Over 100 years' reputation. An eminent Authority on Skin Diseases, HENRY SULLY, Esq., M.D., Surgeon to H.R.H. the Duke of Cumberland, writes Messrs. Beach & Barnicott:—"As I feel no hesitation in recommending anything which I know will do a patient good, and understanding you are the proprietor of the celebrated Medicines of which Dr. Roberts was the inventor, I can have no objection to bear my testimony to their efficacy, which I have repeatedly witnessed. THE BLOOD. The Poor Man's Friend" has, I believe, cured many other medicine."

In his well-known Cure of Skin Diseases Dr. Roberts always prescribed a twofold treatment:—His "Alterative Pills," or his "Anti-Scorbutic Drops," to change the state of the blood and render it pure; and his "Poor Man's Friend," as an Ointment to relieve irritation and to heal the surface.

ALTERATIVE PILLS (Reg'd Title.)

DR. ROBERTS'S ALTERATIVE PILLS, 1s. 13d., 2s. 9d., 4s. 6d., 11s. and 22s. per box.

DR. ROBERTS'S ANTI-SCORBUTIC DROPS (for delicate ladies, for children, and for those who do not like pills), have the SAME EFFECT as DR. ROBERTS'S ALTERATIVE PILLS: 2s. 9d. and 4s. 6d. per bottle.

POOR MAN'S FRIEND

Is the Registered and Protected Title of Dr. ROBERTS'S OINTMENT for ALL WOUNDS and SKIN DISEASES. THE ABOVE MEDICINES are exclusively prepared by Dr. Roberts's Executors, Messrs. Beach & Barnicott, and are sold by most Chemists at 1s. 13d., 2s. 9d., 11s. and 22s. per pot. Order through any Chemist, or send remittance to BEACH & BARNICOTT, BRIDPORT. Pamphlet post-free. Please name this paper.

THE "NEW EASY" LAWN MOWER.

Has an Open Steel Roller.

A man can work a 24-inch machine, cutting Grass 5 inches high clean to roots.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

The Front Roller, with simple adjustment, enables the machine to cut very close to the ground, and to do fine work.

The machine will also cut verges.

To be obtained through all the leading Ironmongers or Seedsmen, or from the Sole Licensees—

NORWICH.

TO CAPITALISTS.

A NURSERYMAN, with an OLD-ESTABLISHED FIRST-CLASS BUSINESS,

IS IN WANT OF £3000 to £5000,

to further Develop a Largely Increasing Business.—Address, in first instance, Box 32, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

PARTNER (Practical) with Capital WANTED, for Nursery Business in Midlothian.—No 25, Keith & Co., Advertising Agents, Edinburgh.

WANTED, a HEAD WORKING GARDENER, where eight or more are kept. He must be a successful Cultivator of all Stove and Greenhouse Plants, as well as Orchids, Roses, and Chrysanthemums, Early and Late Vineries, and Orchard Houses. Must be married, and have personal character for having held a similar situation as Head Gardener.—Apply by letter, stating age and full particulars, and wages required with cottage and fringe, to D. B., Valley End, Chobham.

WANTED, a WORKING GARDENER, to attend to a Lodge in London, and make himself generally useful.—Apply by letter, giving age, experience, wages required, and full particulars, to J. R. H. Chas. Taylor & Co.'s Advertisement Offices, 154—157, Fleet Street, London, E.C.

WANTED, Man and Wife, without incumbency, as GARDENER and LAUNDRESS. Man must thoroughly understand Stock.—Apply, by letter only, to HOUGHTON, Shepperton.

Wanted.

H. CANNELL AND SONS are WANTING a thorough good and experienced MAN, to take the entire Charge of their Rose and Clematis Departments in all branches. Also one for Pansies. Good character indispensable. Letter in first instance.—Swanley, Kent.

WANTED, a FOREMAN, for Horses, to keep a good succession of Bloom, Grow Pot Vines, Graft and Grow Pot Roses, Tree Carnations, Ferns, and ordinary Stove and Greenhouse Plants. One with a knowledge of Orchids preferred.—Apply, stating wages required, and full particulars, to GARAWAY AND CO., Durham Down, Clifton, Bristol.

WANTED, an energetic WORKING FOREMAN, to take the Management of a Fruit and Vegetable Garden of 20 acres, with 2 Houses. Must have a thorough knowledge of producing (on the best method) for Market. Exceptional reference from present or last employer. State age, if married, salary required with percentage. Private Gardeners need not apply.—MANWARING, Cowden, Brenchley, Kent.

Nursery Foreman Wanted.

WANTED, a steady and industrious Man, as NURSERY FOREMAN for a Provincial Nursery.—He must be an expert and successful Budder of Fruit Trees, and possess a knowledge of General Nursery Stock. Wages, 28s. per week.—A. G., Messrs. Hurst & Son, 152, Houndsditch, E.

WANTED, AT ONCE, for Large Gardens and Grounds, a strong, active young MAN. Must have good knowledge all round, and not afraid of work; able to take lead when required.—Apply, with reference, to E. BURTON, He d Gardener, Ben Rhydding Hydropathic Establishment, by Leeds.

WANTED, TWO or THREE MEN, well up in Budding, Training, &c., and General Nursery Work.—THOMAS HORSMAN, Nurseryman, Ilkley.

WANTED, AT ONCE, a young MAN, quick at Potting and Tying. One used to a Market Nursery preferred.—W. ORPWOOD, Cowley Mill Road, Uxbridge, Middlesex.

WANTED, a strong LAD, about 18, under Gardener. One who understands Garden and Nursery Work.—Address, by letter, stating full particulars, last situation, and salary required, Beaufort Lodge, Chelsea, S.W.

WANTED, a young MAN, used to Attending the Fires, and quick at Potting. State by letter wages required and references.—OWEN, 98, Stamford Hill, N.

WANTED, a COWMAN, to attend to eight Cows, and Poultry. Wife or Daughter to attend to Lodge Gates, and keep front steps clean. Accommodation not sufficient for more than two children.—Apply by letter only, with particulars of former situations, and wages required, to S. T. FISHER, Esq., The Grove, Streatham, S.W.

Rockworker and Handy Man.

WANTED, a young MAN, who has had some experience at the above work.—Apply, with particulars and wages expected, to THOS. BUTCHER, The Nurseries, South Norwood, S.E.

WANTED, a strong intelligent LAD, of about 17, to take out Orders, and occasionally Serve Customers.—Apply, stating wages required and references, to MARSHALL BROS. AND CO., 19, Prince Albert Street, Brighton.

GARDENING APPOINTMENTS.

Mr. T. WALLER has been appointed Gardener to Sir WILLIAM VAVESOUR, Hazelwood Castle, Tadcaster, Yorkshire.

Mr. G. POTTS, formerly Gardener to Sir W. ANDERSON OOG, Oakfield, South Dulwich, has been appointed Gardener to Dr. HARRIS, Elm-side, Northiam, Sussex.

WANT PLACES.

NOTICE TO ADVERTISERS—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on an envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE ORDER**.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

WANTED, A GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS. S—JOHN DOWNE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

TO GENTLEMEN and the TRADE—The Advertiser is OPEN to UNDERTAKE the SUPERVISION of PARK and PLEASURE GROUNDS Improvements Road Making, &c., and to Prepare Estimates and Plans.—**WALTER J. MAY**, Walton-on-Thames.

GARDENER (HEAD).—Middle-aged, married; thoroughly experienced; first-rate Grape and Plant Grower, and good Kitchen Gardener; good references.—P., 3, Arney's Cottages, Sutton Common, Surrey.

GARDENER (HEAD).—Age 45, married, no family; practical experience in all branches. Excellent recommendations.—T. D., 192, Fairbridge Road, Upper Holloway, N.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Elliot Yorke, Hamble Cliff, Southampton, can with confidence recommend his Foreman, G. Dovey, as above.

GARDENER (HEAD).—Middle-aged; excellent character for ability, sobriety, industry, and trust. Wife could Assist occasionally in House, if required.—A. B., Mrs. Chamberlain's, Baker, Twickenham.

GARDENER (HEAD).—Age 31; fifteen years' practical experience in all branches. Five and a half years in present situation. Good character. Abstemious. Death of employer cause of leaving.—C. HIGGINS, Wellswood, Torquay, Devon.

GARDENER (HEAD); age 39, married eight years, no family.—A GENTLEMAN highly recommends his Head Gardener; practical. Life experience in Vines, Orchids, Stoves, Greenhouses, Pleasure, Fruit, and Kitchen Gardening.—GEO. MARSHALL, 39, Thralf Road, Streatham, S.W.

IMPROVER, in a Gentleman's Garden.—Age 20; can be well recommended. Steady and energetic.—H. K., Messrs. W. Wood & Son, Woodlands Nursery, Maresfield, Uckfield, Sussex.

IMPROVER; age 20.—The GARDENER, Nyn Park, Barnet, Herts, is anxious to recommend a young man as Improver, in a good Garden. Has been three years in present situation, Inside and Out. Energetic and trustworthy.

APPRENTICE, to a Gardener.—Age 14; respectable. Strong and willing.—W. Q., 14, Model Cottages, Denmark Road, Wimbledon, Surrey.

TO NURSERYMEN and MANAGERS.

Wanted, a situation as Second in the Glass Department, in some good Nursery. Has a fair knowledge of Propagating and Growing general Indoor Stock. Well up in Bouquet and Wreath Making, &c. Can be well recommended.—W. J., 41, Wellington Street, Strand, W.C.

TO NURSERYMEN.—Wanted a situation. Well used to all kinds of Plants, Potting, Tying, &c., for Market, Six years' experience. Good character. Age 20.—T. CREED, Edgar Road, Clive Vale, Hastings.

WAREHOUSE MANAGER or HEAD SHOPMAN.—Sixteen years' thorough practical knowledge in all branches. Highest references.—ALPHA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

To Florists and Seedsmen.

TRAVELLER, SHOPMAN, or MANAGER.—Nine years' good experience. First-class references.—A. H., Mr. Flower, 13, Pier Street, Ryde, Isle of Wight.

TRAVELLER.—Clever young man will shortly be disengaged. Knows best part of kingdom. Could introduce business. Over twelve years' experience of all branches.—W. B., 24, Terrace Road, Huddersworth, Birmingham.

SHOPMAN, with a good experience in the Seed, Plant, and Bulb Trade. Good character.—CYANUS, 41, Wellington Street, Strand, W.C.

SHOPWOMAN (ASSISTANT), in a Florist's or Florist's and Seed Shop—permanency, or for the season.—N. P. P., Steel & Jones, Advertising Agents, Spring Gardens, S.W.

HOLLOWAY'S PILLS were invented in accordance with modern knowledge, modern wants, and scientific progress; their beneficial influence is restricted to neither race nor country, and is available by all who lovingly look to their health. Any abrupt change in the weather always causes much disordered action in the human body. It is a matter of primary importance to rectify every irregularity without delay which it is the power of every one to do by taking Holloway's Pills. These Pills are the best preventives of indigestion, and the mildest aperients ever prescribed. They purify and cool the blood and equalise the circulation through the system, even at the minutest vessels of the skin. They act admirably on the liver and kidneys.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. "The Journal of Horticulture," of June 9, says—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They cut either short or long Grass, wet or dry.

SILENS MESSOR MOWERS,

with Improved Steel Chains and Handles.

Now ready, in cloth, 11s. 6d. THE GARDENERS' CHRONICLE, Vol. II., Third Series, JULY to DEC., 1887. W. RICHARDS, 41, Wellington Street, Strand, W.C.

ROYAL HORTICULTURAL SOCIETY. FELLOWS REQUIRING a LIST of the PLANTS for DISTRIBUTION from the Chiswick Gardens can have a Copy by applying to Mr. A. F. BARRON, Superintendent.

PEOPLE'S PALACE, Mile End Road, E. Chairman—Sir EDMUND HAY CURRIE. FLOWER SHOWS will be held as follows:— June 1 and 2 Spring Flowers. July 6 and 7 Grand Rose Show. August 6 and 7 Grand Summer Flower Show. Schedules may be obtained on application to the Chairman as above. Band of H.M. Scots Guards each evening.

BATH and WEST of ENGLAND and S.C.A., Newport, Mon., JUNE 6, 7, 8, 9, 11. Open.—A Cup or Money value, £10, will be given for the best Group of Orchids; do., £5, for the best Specimen. Tea and Noisette Cut Roses (Amateurs).—A Cup, or Money value, £5, for 18 varieties (single blossoms). Nurserymen.—Do., £5, for 18 varieties (three blossoms). Orchids must be in the Yard by 9 A.M., June 6; Roses, 9 A.M., June 7. J. TOWNSHEND BOSCAWEN, Steward of H.D.

WILTS HORTICULTURAL SOCIETY, Sali-bury. SHOW on AUGUST 23, 1888. Schedules may be had on application to W. H. WILLIAMS, Hon. Secretary. The Nurseries, Sali-bury.

The Best Present for a Gardener. VINES and VINE CULTURE. The most complete and exhaustive Treatise on Grapes and their Culture ever published. New Edition. Price 5s., post-free 5s. 6d. A. F. BARRON, Royal Horticultural Society, Chiswick.

LILY OF THE VALLEY CROWNS For Early and Late Forcing. Delivery in November next. The Advertiser is in a position to compete for the above with any respectable House in the Trade, either at home or abroad, as to price and quality. Particulars on application. Early Orders respectfully solicited. T. JANNOCH, by Special Warrant, Lily of the Valley Grower to H.R.H. the Prince of Wales, Dersingham, King's Lynn.

Plant Now. TROPÆOLUM SPECIOSUM, the well-known hardy scarlet Clumber. Fine strong plants, with numerous strong growths, free and safe by post, out of pots, 1s. each; 9s. per dozen. Cash with order. HOWDEN AND COMPANY, The Nurseries, Inverness, N.H.

Verbenas—Verbenas. WILLIAM BADMAN offers clean, healthy, well-rooted VERBENAS, at 6s. per 100; 50s. per 1000. Purple, White, Scarlet, Rose, and Crimson; or, 1000 Choice Named Sorts for 8s., if post-free 3d. per 100 extra. Packing included. Terms cash. Cemetery Nursery, Gravesend.

SPECIMEN HOLLIES.—Now is the time to plant. LIST, containing heights and prices of the finest Green and Variegated varieties in cultivation free. N.B. These trees are perfect, and very cheap. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

HARTLAND'S FAMOUS DAFFODILS FOR FORCING PURPOSES.—Special Trade Offer of thirty varieties that W. B. H. grows in large quantities, post-free. The foliage is now (May 20) one mass of Green and Gold, and the roots going to rest will be harvested under the most favourable conditions, as bulbs that flower early in the South of Ireland, within 10 miles of these, are naturally better adapted for Forcing and Early Work, than what are grown in more northern districts, and where the spring bloom is retarded. Old-Established Seed Warehouse, 24, Patrick Street, Cork.

EUG. VERVAET DE VOS, Indian Azalea Nurseries, Swynard, near Ghent, Belgium, is preparing his CATALOGUE of Indian Azaleas, Azalea Mollis, Hardy Azaleas, Camellias, Rhododendrons, and Decorative Plants, which will be sent gratis to all applicants.

Rhodantha, White and Red Varieties. Grand stuff, in 5½ inch pots.

HERBERT TITE, Florist, Hampton-on-Thames, begs to offer the above to the Trade, at 50s. per 100, put on rail in London. Cash with order from unknown correspondents.

MESSRS. GREGORY AND EVANS, NURSERYMEN, Sidcup, and 285, 286, 287, 288, Flower Market, Covent Garden, W.C., are open to RECEIVE CONSIGNMENTS of Choice CUT FLOWERS in any quantity for their Commission Department. Boxes and Labels supplied. Telegraph Address—"COMMISSION, SIDCUP."

CHOICE FRUIT and FLOWERS.—Highest Market Prices guaranteed. Empties free. WISE AND RIDES, Covent Garden, W.C.

WANTED, a few Bulbs of Tuberous BEGONIAS (named sorts, for Conservatory), also CYCLAMENS, in EXCHANGE for strong Plants of Count Brazza VIOLET, double white. Apply to T., Eddington House, Hungerford.

WANTED, good strong Plants of CARNATION PINKS "Souvenir de la Malmaison" and "Prince of Orange." Please state quantity and price to T. JACKSON AND SON, Nurserymen, Kingston-on-Thames.

To the Trade. Home-grown VEGETABLE and FIELD SEEDS.

H. AND F. SHARPE are now prepared to make special offers of their fine selected stocks of VEGETABLE and FIELD SEEDS, all of which they have harvested in splendid condition. The prices will be found very advantageous to purchasers. Seed Growing Establishment, Wisbech.

W. H. LASCELLES AND CO., HORTICULTURAL BUILDERS, 121, BUNHILL ROW, LONDON, E.C. Plus and Estimates Free. See large Advertisement, May 5, page 651.

SALES BY AUCTION.

To Florists, Nurserymen, and Others.

At a nominal reserve.—Lewisham, Kent, 10 minutes' walk from Station.

COLLEGE PARK NURSERIES, comprising nearly 3 acres, with 500 feet run of Glass (stocked with Camellias, Stephanotis, &c.), and an excellent Residence. Lease seventy years. Ground Rent, £35.

MR. WM. HODSOLL will SELL by AUCTION, at the Auction Mart, E.C., on THURSDAY, May 31, the above DESIRABLE PROPERTY, with the Goodwill of the Business, by order of the Proprietor, who is relinquishing, owing to ill-health. The Nursery is within easy reach of Covent Garden, and in the heart of a good residential district, and an excellent opportunity is offered for the acquisition of a business of a pleasant and profitable character.

Particulars of Messrs. HUGHES AND GLEADOW, Solicitors, 40, Gracechurch Street, E.C.; and of the Auctioneer, Farningham and Gravesend.

Leytonstone.—Annual Sale.

15,000 BEDDING and GREENHOUSE PLANTS, well grown; 5000 GERANIUMS of the best sorts, choice AZALEAS, FUCHSIAS, PELARGONIUMS, PALMS, FERNS, and a great variety of OTHER PLANTS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, on the Premises, the American Nurseries, Leytonstone (3 minutes' from the station), on SATURDAY, May 26, at 1 o'clock.

On view the day prior and morning of Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, E.C., and Leytonstone.

Special Sale, Monday Next, May 28.

IMPORTANT SALE. POSITIVELY WITHOUT RESERVE.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on MONDAY NEXT, May 28, at half-past 12 o'clock precisely, a grand importation of VANDA HOOKERIANA, in specially fine condition; the extremely rare and beautiful ODONTOGLOSSUM NEVADENSE, good plants of O. HASTULAEFORME, splendid masses of O. PESCATOREI, CYMBIDIUM LOWIANUM, with fine healthy breaks; CATTLEYA GIGAS, ODONTOGLOSSUM species, O. TRIUMPHANS, a specially good lot of O. SCETHEUM, ONCIDIUM LEUCOCHEILUM, ODONTOGLOSSUM PHALENOPSIS, ONCIDIUM BIFOLIUM and MAJUS, in exceptional masses; CATTLEYA MENDELLI, &c.

On view morning of Sale, and Catalogues had.

Monday Next, May 28.

CHYSIS species, magnificent variety.

MESSRS. PROTHEROE AND MORRIS will include in the SALE of ORCHIDS at their Central Sale Rooms, on MONDAY NEXT, by order of Mr. F. Sander, without reserve, a splendid form of CHYSIS, flowers dark and light orange-yellow, and very fine. The specimen is in grand health.

On view morning of Sale, and Catalogues had.

Sale Monday Next, May 28.

New ODONTOGLOSSUM, in flower.

MESSRS. PROTHEROE AND MORRIS will include in the SALE of ORCHIDS, at their Central Sale Rooms, on MONDAY NEXT, by order of Mr. F. Sander, a most superb bright and fine new form of ODONTOGLOSSUM CRISPUM, distinct and extraordinary—probably more so than any previously flowered in this country. This is the only plant, and it is offered without reserve.

On view morning of Sale, and Catalogues had.

Special Sale.—Monday Next.

CATTLEYA ARNOLDIANA, in flower.

MESSRS. PROTHEROE AND MORRIS will include in the SALE of ORCHIDS, at their Central Sale Rooms, on MONDAY NEXT, by order of Mr. F. Sander, a fine plant of the rare CATTLEYA ARNOLDIANA. This is absolutely the only plant in existence, excepting those sold in 1883. For full description, see *Gardeners' Chronicle*, July 5, 1884, page 7.

The specimen has eleven bulbs, nine of them with leaves, and three leading growths and four flowers, and is to be sold without reserve.

On view morning of Sale, and Catalogues had.

Special Sale, Monday Next, May 28.

CATTLEYA LAWRENCEANA.

ONCIDIUM UNDULATUM.

WITHOUT RESERVE.

MESSRS. PROTHEROE AND MORRIS will include in the SALE of ORCHIDS, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY NEXT, by order of Mr. F. Sander, a specially fine lot of CATTLEYA LAWRENCEANA, consisting of splendid specimen plants, and a splendid lot of the extremely rare ONCIDIUM UNDULATUM.

On view morning of Sale and Catalogues had.

Monday, May 28.

ODONTOGLOSSUM NEVADENSE, without reserve.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on MONDAY NEXT, May 28, at half-past 12 o'clock precisely, fine established plants of this extremely rare and beautiful Odontoglossum, very few of which exist in collections.

On view morning of Sale, and Catalogues had.

Monday Next, May 28.

VANDA HOOKERIANA, WITHOUT RESERVE.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on MONDAY NEXT, May 28, at half-past 12 o'clock precisely, a grand importation of VANDA HOOKERIANA. This species is very difficult to import, and the consignment is in a specially fine condition.

On view morning of Sale, and Catalogues had.

Acton, W.—Monday Next.

6000 well-grown BEDDING and GREENHOUSE PLANTS of the usual description.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, on the Premises, The Priory Nursery, Chaucer Road, Acton, W. (close to the Station, N. L. Railway), on MONDAY NEXT, May 28, at 1 o'clock, by order of Mr. B. Harding, without reserve.

May only be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68 Cheapside, E.C.

Tuesday Next.—Orchids in Flower.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, May 29, at half-past 12 o'clock, precisely, over 300 lots of ORCHIDS in FLOWER, from various collections, including numerous plants and fine varieties of Odontoglossum Alexandre, O. Pescatorei, O. vexillarium, Oncidiums, Dendrobiums, Cypripediums, Masdevallia Veitchii grandiflora and Harryana, Oncidium macranthum, two grand specimens; Sobralia macrantha, Cattleya gigas, C. Menziesii and C. Mossie; Lælia purpurata, Russelliana, and other ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.

CYPRIPEDIUM BELLATULUM, Rehb. l. MESSRS. PROTHEROE AND MORRIS beg to announce that the PLANT in FLOWER, to which was awarded a First-class Certificate by the Royal Horticultural Society, on May 22, will be ON VIEW, at their Sale Rooms, on FRIDAY NEXT, June 1.

This species will prove a gem amongst Cypripediums, and Gentlemen will be able to form their own opinion of the enhanced beauty that may be expected from flowers produced on established plants when it is stated that these on the plant exhibited were found partially formed in the case when unpacked.

Friday Next.

HIGHLY IMPORTANT SALE.

AÆRIDES FIELDINGII varieties, CYPRIPEDIUM BELLATULUM, DENDROBIUM FINDLEYANUM, D. HERCOSTEUM, PHALENOPSIS GLORIOSA, Rehb. f.; SACCOLABIUM GUTTATUM, VANDA AMESIANA, V. ROXBURGHII.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 1, at half-past 12 o'clock, precisely, by order of Messrs. Hugh Low & Co., very large quantities of choice imported ORCHIDS, in the finest possible condition, comprising Aërides Fieldingii varieties, several hundreds of Cypripedium Bellatulum, C. Boxallii, C. hirsutissimum, C. Parishii, Dendrobium Findleyanum in quantity, one of the most highly prized species, now rare in collections; D. hercoglossum, a lovely species described in *Gardeners' Chronicle*, October 16, 1886; D. signatum, D. Brymerianum, D. chrysolis, D. Bensoniae, D. heterocarpum, D. nobile, marvellous masses; D. Wardianum, D. Lowii, Phalenopsis gloriosa, Rehb. l., *Gardeners' Chronicle*, May 5, 1888; Saccolabium ampullaceum, S. guttatum, probably the finest ever offered; Vanda Amesiana, seen by collector with 185 flowers on one plant; V. Roxburghii, the finest ever imported; and other choice ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.

The Broomfield Collection of ESTABLISHED ORCHIDS. Important Unreserved Sale of the Second Portion of this celebrated collection of ESTABLISHED ORCHIDS, by order of Robert Warner, Esq., who is giving up the orchid business in consequence of long-continued ill health. 1000 ODONTOGLOSSUM ALEXANDRE, not a single plant having yet flowered in this country.

MESSRS. PROTHEROE AND MORRIS are instructed by Robert Warner, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, June 1, at half-past 12 o'clock precisely, the Second Portion of his well-known collection of ESTABLISHED ORCHIDS, consisting of about 1000 Odontoglossum Alexandre, entirely unflowered plants. The whole were collected by Mr. Carder specially for Mr. Warner, and amongst those which have flowered from the same importation numerous well-known varieties have bloomed. Also a very fine lot of special varieties of LÆLIA PURPURATA. The whole of the Sale absolutely without reserve.

On view morning of Sale, and Catalogues had.

South Tottenham.

To Florists and Others.—By order of the Executors, under the Will of Mrs. May Wilday, deceased, a block of FREEHOLD BUILDING LAND, comprising an area of over a quarter of an Acre with eight span-roof Greenhouses standing thereon. The property has a frontage of 65 feet to Clyde Road, South Tottenham, by a depth of about 198 feet, and will be sold with possession.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE of PROPERTIES, at the Mart, Tokenhouse Yard, on FRIDAY NEXT, June 1, at 2 o'clock precisely. Priced particulars to be had of the Auctioneers, 67 and 68, Cheapside, E.C.

Established Orchids.

Unreserved Sale of the First Portion of ESTABLISHED ORCHIDS formed by Dr. Duke, of The Glen, Lewisham.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Dr. Duke to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, June 5, at half-past 12 o'clock precisely, without Reserve, the First Portion of his Collection of ESTABLISHED ORCHIDS, comprising, amongst others, splendid plants of the following:—

- | | |
|----------------------|--------------------------------|
| Cologyne Massangeana | Cypripedium Lindeni candidulum |
| „ Lowii | „ Sanderaianum |

| „ Cervantesi decorum | Miltonia candida, true |
| Cattleya Wagneri | „ Moreliana atro-purpurea |
| „ gigas | „ „ „ Regnellii purpurea |
| „ Sanderiana, &c | |

No plants will be sold privately prior to the Sale. Catalogues will be ready in due course, and may be obtained of the Auctioneers, 67 and 68, Cheapside, E.C.

Preliminary Notice.

The DOWNSIDE COLLECTION of ORCHIDS. HIGHLY IMPORTANT SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of Established Orchids that has ever been submitted to Public Competition.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Wm. Lee, Esq. (who is selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL by AUCTION, on the Premises, Downside, Leatherhead, in the month of JULY NEXT, the whole of this most valuable Collection of ESTABLISHED ORCHIDS.

The days of Sale, and further particulars will shortly be published.

Messrs. P. & M. desire to mention that no plants will be Sold Privately, but that the whole will be submitted to Public Competition.

Central Auction Rooms and Estate Offices, 67 and 68, Cheapside, London, E.C.

Thursday Next.—(Sale No. 7686.)

Fig. B.

EXTRACTS FROM TESTIMONIALS.

VILLAGE WATER SUPPLY.

From Mr. THOMAS VARLEY,

Agent to the Trustees of the late William Roundell, Esq., Gledstone Estate, West Marton, Skipton, August 11, 1887.

"DEAR SIR,—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of 2 miles from, and at an elevation of 280 feet above the ram. The water is then gravitated through several pipes and branches, having a total length of about 4 miles, for the supply of the mansion, gardens, stables, estate workshop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilise the water for other farms. I have much pleasure in being able to report as above."

From J. B. McCALLUM, Esq., C.E.,

Borough and Water Engineer, Blackburn, November 1, 1886. Guide (Borough of Blackburn) Water Supply.

"DEAR SIR,—Following is the short report I promised to send as to the work performed by the Hydraulic Rams—supplied by you to the Blackburn Corporation—after they had been in operation sufficient time to take proper observations.

"The district of Guide—population about 500—in the Borough of Blackburn, is situated above the highest reservoir of the Blackburn Waterworks, and had no regular water supply until last July, when the Water Committee caused two of your Patent Hydraulic Rams to be put down and worked by water from a reservoir having a varying but maximum head of 34 feet 3 inches on the Rams—the waste (clean) water gravitating to a lower adjacent reservoir.

"You contracted to supply rams which would force 8000 gallons per day each through 1295 yards of delivery pipe to a service tank 170 feet above the rams, and I am bound to state that the result has considerably exceeded my expectations, as the rams are capable of pumping, and have pumped, much more water than you promised. The percentage of efficiency exceeds all I expected, and is, in my opinion, much more than is usually obtained from hydraulic rams.

"From a test I made on September 29, I found that two rams with $\frac{1}{2}$ -inch and $\frac{3}{4}$ -inch strokes respectively, supplied with 194,730 gallons per day, together pumped 26,090 gallons per day to a height of 170 feet, giving 71.43 per cent. of efficiency, and one ram working at $\frac{3}{4}$ -inch stroke, and with only 16—18 feet of working fall, supplied with 154,587 gallons per day, pumped 10,587 gallons per day to the same height, showing 72.75 per cent. of efficiency.

"At a subsequent test on October 11, one ram at $\frac{3}{4}$ -inch stroke, and having 31 feet 9 inches of working fall supplied with 121,083 gallons per day, pumped 17,583 gallons per day to an elevation of 171 feet, the efficiency in this case being 79.57 per cent.

"In arriving at these results the greatest care was taken to positively measure the water, besides having a meter check on feed and delivery pipes.

"The work carried out by you at Blackburn is substantial and satisfactory in every way, and if any engineer wishes to make his own observations he is at liberty to come here and do so."

From Mr. HENRY ROBINSON,

Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From Mr. J. A. RUTHERFORD,

Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middlesborough, September 26, 1883.

"DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate, for Mr. C. F. H. Bolckow, are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11½ gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since."

The Delivery Pipe, in the above case, is 9000 feet in length.

From THOMAS ROBERTS, Esq.,

Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trentham Hall, Staffordshire, April 13, 1886.

"DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Titensor (the residence of the Marquess of Stafford, M.P.) does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 9000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.—I am yours faithfully,

"THOMAS ROBERTS."

From HENRY MORTON, Esq.,

Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 12, 1886.

"DEAR SIR,—The Patent Ram, with $\frac{1}{2}$ mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Copt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 127 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 804 yards long, with a fall of 70 feet to the service-cocks and fire-plugs at Copt Hewick Hall, where in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

"I consider your method of carrying out the work is everything that could be desired, and, whilst the waste-water from the Ram is less than you specified, the quantity elevated is just what you guaranteed.—I am, dear sir, yours very truly,

"HENRY MORTON."

From WILLIAM DICKINSON, Esq.,

Agent to the Most Honourable the Marquess of Abergeenny, K.G., Eridge Estate Office, Hargate Lodge, Tunbridge Wells, July 3, 1885.

"SIR,—I am instructed by the Marquess of Abergeenny to say that the Patent Hydraulic Ram, with over two miles of pipes, forcing water to a height of 230 feet, which you erected at Eridge Castle about nine months ago, has given his lordship entire satisfaction, and he has every confidence in its continuing to do so.—I am, sir, yours faithfully,

"WILLIAM DICKINSON."

From Captain TOWNSHEND,

Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE, ENGLAND.

ORCHID EXHIBITION.

One of the most beautiful sights
in London.

ORCHIDS.—The Orchid Exhibition at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W., is open daily from 10 to 6 o'clock.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"A scene of the greatest Orchidic beauty, baffling description, and defying exaggeration."

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

NEW PLANTS FOR 1888

MR. WILLIAM BULL'S
NEW CATALOGUE FOR 1888,

Now Ready, Price 1s.,

Containing Names, Descriptions, and Prices of many beautiful New Plants offered for the first time.

WILLIAM BULL, F.L.S.,

Establishment for New and Rare Plants,

536, KING'S ROAD, CHELSEA, S.W.

NEW PEDIGREE ROSES.

ALEX. DICKSON & SONS

Begin to announce for delivery the end of May, their two superb Novelties, "Caroline d'Arden," H.P., and "Lady Castlereagh," Tea, awarded several First-class Certificates.

Strong Plants, in pots, now ready, of last season's set, viz., "Earl of Dufferin," "Lady Helen Stewart," and "Miss Ethel Brownlow."

Descriptive Priced LIST free on application to the

ROYAL NURSERIES, NEWTOWNARDS.

FERNS A SPECIALTY.

The largest, most complete, and profusely ILLUSTRATED CATALOGUE OF FERNS ever published, containing over 120 Illustrations, and much valuable practical information on the cultivation of Ferns, &c. 1s. 6d. post-free. Smaller Catalogue of over 1300 species and varieties free on application.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

NEW ROSES.

WM. PAUL & SON,

Rose Growers by Appointment to Her
Majesty The Queen,

WALTHAM CROSS, HERTS,

RESPECTFULLY SOLICIT ORDERS FOR THE FOLLOWING NEW
ROSES:—

DUCHESS OF ALBANY, H.P. (Wm. Paul & Son).—A sport from LA FRANCE, with flowers deeper in colour and larger in size than the parent variety. It has been fully tested at Waltham Cross, and has been greatly admired by all Rosarians who have seen it.

The *Journal of Horticulture* says of this Rose:—"It is totally distinct in colour, both surfaces of the petals being of a rich dark rose tint. In the bud state it is extremely beautiful. For bouquets, button-holes, wreaths, or indeed any decorative purpose it is admirable."

The *Garden* describes the flowers as "of a bright pink shade of colour, large and full, quite distinct from and much better than those of LA FRANCE."

Plants ready the end of May, 10s. 6d. each.

GRAND MOGUL, H.P. (Wm. Paul & Son).—A seedling from A. K. Williams; deep brilliant crimson shaded with scarlet and black. First-class Certificate Royal Horticultural Society.

Plants now ready, 3s. 6d. each.

SILVER QUEEN, H.P. (Wm. Paul & Son).—Silvery blush shaded with rosy-pink, very soft and pleasing; produced in great abundance; quite first-rate.

Plants now ready, 3s. 6d. each.

THE PURITAN, H.P.—One of the most beautiful and valuable of New Roses. White, large, handsome, and sweet; produced in great abundance.

Plants now ready, 3s. 6d. each.

NOTE.—Wm. Paul & Son were the original distributors of this and the two following varieties, and have still the largest stock of the best plants of them:—

MR. JOHN LAING, H.P.—Soft pink, large, and finely shaped, very sweet; free and good.

Plants now ready, 3s. 6d. each.

THE METEOR, H.T.—Deep velvety crimson, of medium size; exceedingly valuable for pot culture and winter-blooming.

Plants now ready, 3s. 6d. each.

The following Roses of recent introduction are also now ready:—

FLORENCE PAUL, H.P. (Wm. Paul & Son).—Scarlet-crimson shaded with rose, 2s. 6d.

CHARLES DICKENS, H.P. (Wm. Paul & Son).—Rose colour, hardy and profuse. A grand bedding Rose, 2s. 6d.

GLOIRE DE MARGOTTIN, H.P.—Dazzling red, 3s. 6d.

MADAME HOSTE, Tea-scented.—Pale yellow, deeper centres. First-class Certificate, Royal Horticultural Society, to Wm. Paul & Son, May 8, 1888, 3s.

THE BRIDE, Tea-scented.—White, very large and full; quite first-rate, 2s. each, 18s. per dozen.

HER MAJESTY, H.P.—Satin-rose, very large, 1s. 6d.

EARL OF DUFFERIN, H.P.—Velvety crimson, shaded with maroon, 3s. 6d.

SIR ROWLAND HILL, H.P.—Maroon, 7s. 6d.

WALTHAM OLIMBERS, No. 1, 2 and 3, 2s. each. Very valuable red, perpetual-flowering, climbing Roses.

The New French Roses of 1888, 3s. each, 30s. per dozen.

The New French Roses of 1887, 2s. each, 21s. per dozen.

All other New Roses at advertised prices.

Priced Descriptive Catalogue of New Roses
Post-free on application.

PAULS' NURSERIES, WALTHAM CROSS.

WINDOW-BOXES.

THE bay window of the room in which this is written is fitted with boxes placed on the ledge outside, and formed in three divisions, 9 feet long, 10 inches wide, and 6 inches deep, and each box is well drained by a number of holes in the bottom, and by a layer of broken crocks. The boxes were made by a journeyman carpenter at a cost of 15s., and are painted green. I might have filled my bays with zinc troughs filled with Minton's tiles, having the colours stamped and burnt in, or with Doulton's hand-painted tiles, each tile being to that extent a work of art, and costing 3s. or 4s. or more, while the stamped tiles cost from 7d. to 1s. each. Boxes like mine may have their plainness relieved by the well-known device of nailing pieces of cork in the front in rustic fashion, but Ivy planted in them and trained and nailed thickly, so as to completely hide both the deal and its paint, is, to my mind, more handsome, and far more durable than cork, and superior in some cases even to tiles. Ornate window-boxes may be quite in keeping with other *tout ensemble* of costly dwellings, but for those of humbler pretensions plain boxes seem preferable. Among the trailing plants Ivies are the most permanent and continuous in their effect, serving for summer as well as winter. The gold and silver variegated Ivies and those with finely-cut leaves are the handsomest, but they are proportionately slow in their growth.

The aspect of this particular window being north, certain plants are specially suitable to it. Last year a row of well-grown Fuchsias of several sorts, filling the whole length of the bay, with an edging of small Ferns and blue Lobelias for relief, and the green apron of Ivy hanging below, made the owner's heart proud. It is the notion of some people, who live secluded in parks and pleasaunces, that the public should be excluded by barriers placed at least a mile from their sacred edifices. This, however, is an error, handed down from the barbarous ages when men were full of fight and mischief, and went about armed for destruction. In these days more than half the population reside in towns, and nine-

tenths of the total number of the window-boxes are in these towns and their suburbs. Mine are in a street of thirty houses, where, with twice that number of window-boxes we garden partly for our neighbours, so that all the world enjoys our window-boxes, or may do so and welcome. Last year the Fuchsias were the "observed of all observers." On the opposite side of the house Pelargoniums and other lovers of the sun do better in the boxes than Fuchsias.

During the past winter my boxes have been filled with evergreens, including variegated *Euonymus*, *Ancuba japonica*, *Thuia aurea*, delicate *Cupressus*, and some plants of *Yucca recurva* which are much admired. These were all well grown specimens, filling up the boxes handsomely. Small plants would have been looked on askant by the neighbours as poor skinny things. If economy be an object, these same plants may remain in the boxes the whole year round. For the sake of variety, I prefer to remove the evergreens, which are plunged in their pots in the garden on the south side of the house, to be used again next autumn. The boxes are refilled immediately—Crocuses, early Tulips, Hyacinths, Double Snowdrops, Primroses, Hepaticas, and Violets, being amongst the earliest flowers adapted for that purpose. *Aubrietia* and various alpine may be introduced at this time. I have a box whose edges are at this moment overhanging nicely with four varieties of bright green *Saxifragas*, and several other plants of that class which are found in most nurseries clambering over rockwork, or overlapping the face of dwarf walls. It is needless to name all these things, space forbidding it, and the intelligent student of box-gardening will soon discover that the methods of decoration are inexhaustible and that he must necessarily set some limits to the sorts he cultivates. The alpine alone, or Ferns and *Selaginellas*, are charming subjects, especially for north aspects.

Flowers that come next in succession are *Narcissus*, *Anemone*, *Ranunculus*, *Polyanthus*, *Pansy*, *Wallflowers*, *Lily of the Valley*, *Brompton Stocks*, *Daisy*, and *Viola*. Then come *Nemophilla* and *Mignonette*, *Lobelia speciosa*, *Echeverias*, *Cyclamens*, *Musk*, *Heath*, *Amaranthus*, *Cinerarias*, the graceful *Dielytra spectabilis*, and many others, followed by all the flowers of summer. Unless a beginner has great confidence in his or her original genius I would recommend copying the work of others, just as artists in another department study the models of their predecessors. The following arrangement has been admired—the box painted green and planted with scarlet and white *Pelargonium* mixed with yellow *Calceolarias* bordered with *Musk* and *Lobelia speciosa*. But the last touch of art was the arch wreathed with *Canary Creeper* (*Tropæolum peregrinum*, commonly called *canariensis*), and passing from end to end of the box. Arches above window-boxes may be objectionable in some cases, as they obscure the view; but that does not apply to the training of creepers up the sides of the windows, which has a charming effect. The various kinds of *Pelargoniums* head the list of summer flowers for boxes, and they are grown now in such variety that contrasts may be obtained without the use of other flowers, except small ones used as edgings; or the *Pelargoniums* may be planted with patches of such annuals as *Nemophilla* and *Mignonette* between them, edged with the plants already named, and with *Sweet Peas*, *Convolvulus*, *Canary Creeper*, and *Eceremo-carpus scabra* running up the window sides.

Subtropical plants, such as *Dracena*, *Ficus*,

Palms, and others, have become favourites in recent times, but without enlarging on them here, I must be content to notice two methods by which renewals may be effected, namely, by means of one's own reserve garden and greenhouse, or by purchase. The latter is probably the cheapest method, especially in towns where plants of all sorts are provided in enormous quantities, and where private gardening is a costly pleasure. *H. E.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM BELLATULUM, n. sp.

This is near to *C. Godefroyæ*. The leaves, however, are blunt, very strong, 10 inches long by 3 inches in width, beautifully marbled with light hieroglyphic spots above, with innumerable brown dots underneath. The immense flower, 11 inches in circumference, is spotted all over, some of the spots being very large; the colour is white, or whitish-yellow. It is an introduction of the indefatigable Messrs H. Low & Co. The staminode is novel. It is much longer than in any other variety, oblong, tridentate at the apex, nearly free from hairs, and beautifully spotted. This peculiarity I have never seen in any of the affinity, and this induces me to make a new species. I have studied numbers of flowers of the affinity. No one, however, has been so liberal in sending specimens as Mr. W. Lee, who, during 1886 and 1887 sent me numbers of flowers of *Cypridium Godefroyæ* always with their leaves. And all that number does not show a single staminode comparable to that of Mr. S. Low's sending. *H. G. Rehb. f.* [Certificated at the Royal Horticultural Society, May 22. Eo.]

POLYSTACHYA LEONENSIS, Rehb. f.

This curious little *Polystachya*, described a long time ago from a dried specimen collected by Barter in the Niger Expedition (*Otia Bot. Hamburg*, p. 112) has at length been introduced alive, and may be seen in flower in the Kew collection. It was received from Sierra Leone, and so closely resembles Barter's dried specimen that I have scarcely a doubt it belongs to the same species. The very characteristic thick roots, clothed with white velvety tomentum, the habit, and the velutinous peduncle and pedicels, are precisely identical; and, although the racemes are at present a little shorter, I think this is merely a question of development, for I can find no essential difference in the flowers. This specimen enables me to add a note as to the bulbs, also the colour of the flower. The bulbs are globose-depressed, half an inch across, and arranged in a string along the creeping rhizome so thickly as to touch each other. The upper sepals and petals are light green, the lateral sepals suffused with brownish-purple in their lower half, the lip white, with the lateral lobes suffused with light purple behind, the front lobe, the central keel and the basal part of the lip covered with a curious white mealliness. *R. A. Rolfe.*

FOREIGN CORRESPONDENCE.

ARAUCARIA EXCELSA.

This beautiful Conifer, the Norfolk Island Pine, is at home in the calcareous rock soil of the Mediterranean shores. It has been introduced nearly everywhere, and thrives everywhere, provided there is plenty of lime in the soil and a moderate amount of moisture. I have seen it growing luxuriantly in the Malta gardens, in the Balearic Islands, in Spain, in the *Alameda*, or public garden at Valencia. It thrives in all our Riviera gardens, and is luxuriant at Monte Carlo, and in my rock terraces, in a soil all but entirely composed of lime, with very little vegetable loam. The marine air must remind the *Araucaria excelsa* of its native home—Norfolk Island, in the

Pacific, to the north end of Australia, lat. 29°. The soil of this island is, no doubt, calcareous. I have several of these handsome trees, two more especially, which, although only fifteen years old, rise nearly as high as the summit of the Grimaldi Tower, which is 66 feet from the ground.

They bear the summer heat and drought, but want moisture at some periods of the year to thrive, and must have a considerable amount of soil under them. I planted several on small terraces in pockets on the rocks above and around me; but they only lived, did not thrive. This is the case with *Agaves* and *Aloes*, and with many other plants from dry regions like Mexico, Australia, and the Cape. With little or no soil they live on healthily, but remain small, merely vegetating. Given soil, even in moderation, they go ahead rapidly. I had occasion to transplant a year ago two large trees for the foundation of a house I am building. Not having the proper appliances, and the trees being on the mountain-side, it was a difficult business. I had forty men, however, to assist, so we managed the transfer by cutting a round ball of earth, preserving roots as much as possible, and then raising the entire mass by pulleys and levers, and then dropping them into the terrace lower down destined to receive them, just as the mast of a vessel is raised and dropped into its place. They were freely watered every second or third day all the summer, have survived, and are doing well.

This operation gave me an insight into the root-growth of these trees. There was a mass of fibrous roots that had penetrated into every crevice of the rock, like seaweed on shore rocks. They had found their way into every fissure, and covered the jagged rocks with fibres like a mat. We had always well irrigated these trees; the water had sunk into the rocks, and the root-fibres had followed it everywhere. It quite convinced my garden subordinates that I was right when I talked of "watering the rocks" in winter to secure tree-growth in the dry summer. Before this they had thought me half crazed to water after rain, to get at the rocks. The terrace on which they were growing being below others on the mountain-side, water discharged on the terraces above had constantly filtered down to their roots, which explained their luxuriant growth.

I find that in summer, if the soil or rocks get too dry, the *Araucarias* begin to shed their foliage, so this is now my criterion. The moment the leaves on the lower branches begin to fall I have the soil in which they grow freely irrigated, and they at once cease to fall. I have made one of my numerous tanks overflow at will in the vicinity of my two largest trees, and thus have secured frequent and thorough irrigation in summer. Since I have done this, for the last two years, their growth has been much more vigorous, and the length of the bole between the annually formed whorls of branches and leaves has much increased.

At Monte Carlo there are several fine specimens of this Conifer. They are growing rather differently to what they do with me—more thick-set, the whorls of branches nearer together, more pyramidal in a word. With me, on the mountain-side, they are running up. As in their native home they are said to reach a height of 200 feet, I am in hopes that my trees, well watered and attended to, will become very tall, and right pleasant to the sight, should I live to behold it.

I have the *Araucaria brasiliensis* also, but it merely vegetates. Our winter is probably too cold; I can, however, scarcely understand the *A. excelsa* doing so well in the Mediterranean; for Norfolk Island—where only, I believe, it is found wild, is only 29° from the equator. It is a most beautiful and singular tree, confined to Norfolk Island in the Pacific, 1000 miles north-east of Sydney, and which is merely a few miles in circumference, 5 miles in diameter by 2½. Its flora has a great affinity to the Australian vegetation, I believe, while the *Araucaria* is found in a fossil state in the carboniferous sandstone, or at least, fossil Conifers of that type are so found. Thus it may be a remains of the vegetable world that flourished on

a great continent in the Pacific Ocean in past geological eras; a singular and grand thought. The *A. excelsa* is one of the most beautiful of the Coniferae, and may again become common all over the world

NATAL NOTES.

FREESIA REFRACTA ALBA.—I have read with interest the recent correspondence in the *Gardeners*

seem accommodating, as they flourish equally well in clayey soil, black loam, or sand. After a careful raking the ground is laid out in beds, and the bulbs planted in drills. From the time of planting to flowering, which is in September—our first spring month—all weeds must be kept down, otherwise the crop will be smothered. Very little rain falls all this time, but the soil keeps tolerably moist till towards spring. Early in September, with a temperature of 60°—70° day and 40°—50° night, the flowers begin to expand, and very lovely they are, so acceptable at the time of year; their perfume, as is well known, is strong and delicious. If, as is generally the case at this juncture, the weather keeps very dry, the beds must be well watered by water-can, hose or irrigation. As soon as the bulbs are ripe—some time near December—they must be lifted and kept in a dry place, as if left in the ground the summer rains would rot them. In their native country, where the summer is a dry one, I believe they are allowed to remain in the soil until required for export. I venture to suggest that this *Freesia* might be grown in the south of France, and other suitable places, for perfumery.

SUTHERLANDIA FRUTESCENS.

A leguminous shrub, with handsome scarlet racemose flowers. A native of the Cape, Natal, and Free State. An infusion of the leaves and flowers of this plant has been long known amongst the Dutch as a remedy for cancer.

A COMPARISON BETWEEN CAPE AND NATAL PLANTS.

Grahamstown List.

<i>Barosma scoparia</i>	<i>Rhus obovata</i>
<i>Cyrtanthus obliquus</i>	<i>Senecio concolor</i>
<i>Habenaria speciosa</i>	<i>Struthiola ovata</i>
<i>Metalsia muricata</i>	<i>Selago corymbosa</i>
<i>Protea cynaroides</i>	

Maritzburg List.

<i>Aristea Eckloni</i>	<i>Pavetta assimilis</i>
<i>Clerodendron glabrum</i>	<i>Pentstemon variabilis</i>
<i>Dracaenops</i>	<i>Strobilium speciosum</i>
<i>Guzmania serrulata</i>	<i>Sisymbrium cordatum</i>
<i>Ochna atropurpurea</i>	

Few things could better show the great difference between the flora of the Cape and Natal than a comparison of the above lists, as in both cases they fairly represent local plants. Grahamstown is situated about 300 miles south-west of this place; the elevation is 1700 feet, whilst we are 2000. The rainfall is about the same in both cases—30 inches; and we are both near enough to the sea to feel the winds from thence, Grahamstown being 30 miles from the coast, whilst we are some 20 miles further inland. More than this, Grahamstown is by the best authorities reckoned within the same floral region as Natal, since its plants are more like ours than the strictly Cape ones. A list of typical Cape plants would include—

<i>Amaryllis belladonna</i>	<i>Helichrysum vestitum</i>
<i>Acetosis acaulis</i>	<i>Leucadendron argenteum</i>
<i>Barosma crenulata</i>	<i>Protea speciosa</i>
<i>Draca grandiflora</i>	<i>Rochea coccinea</i> , &c.,
<i>Erica coccinea</i>	

which is seen to differ still more from Natal. The produce cultivated in the Cape districts, broadly speaking, is Tobacco, Wheat, and the Vine. Round Maritzburg the staple crop is Maize and subtropical fruits, with Sugar, Tea, and Coffee on the coast. Thus, one part of South Africa supplies just what the other stands in need of. *R. W. Allam*.

ORCHID NOTES AND GLEANINGS.

LISSOCHILUS PARVIFLORUS, Lindl.

This apparently very rare South African Orchid may now be seen flowering at Kew, together with two other species of the genus. *L. parviflorus* was described by Lindley over half a century ago (*Gen. and Sp. Orch.*, p. 191) from a single dried specimen in the Hookerian Herbarium; and soon afterwards the same author saw a living specimen from the stoves of Messrs. Loddiges of Hackney. This is described in the *Botanical Register* for 1838 (*Misc.*, p. 11), and there is an excellent coloured drawing of

FIG. 85.—ARAUCARIA EXCELSA. (SEE P. 648.)

in mild climates near the sea—now it has escaped from its modern island home. *Henry Bennet, M.D., Torre di Grimaldi, Italy.*

[In this country the tree forms a grandly decorative plant for large conservatories, such as the Temperate-house at Kew. See also p. 651 of the present issue, Ed.]

Chronicle on *Freesia* culture, and as the bulbs are grown here with much success, I may be allowed to give my experience. This *Freesia* is not, I believe, a native of Natal, but of the Cape, and is only known here under cultivation. Late in autumn—that is, in March—ground is got ready, a good manuring and thorough digging being indispensable. *Freesias*

a single flower in the Lindley Herbarium. Both these specimens are reported as coming from Algoa Bay, and are the only ones I have seen, with the exception of the one now flowering at Kew, already mentioned. The habit is tolerably similar to that of *L. Krebsii*, but the leaves are barely over half an inch broad, the racemes more compact and the flowers a little smaller. The petals, however, are not yellow, but heavily veined with reddish-brown, a little darker than the markings on the sepals; the ground colour being light green. The front lobe of the lip is deep yellow, much flatter than in *L. Krebsii*; the side lobes veined with reddish-purple. *L. streptopetalus* and *L. Krebsii* are the two others above-mentioned as also in flower. The latter is well known, and the former much resembles it, though smaller in every respect. The petals are paler yellow, the sepals much less heavily marked, and the front lobe of the lip flatter and shorter. *R. A. Rolfe*.

CIMRHOPETALUM CUMINGII, Lindl.

This graceful little plant, one of the prettiest species of a very singular little genus, is now flowering in the Kew collection. The flowers, which are of a warm reddish-purple, are arranged in a spreading circle, in an umbellate fashion, as in the case of other species of the genus. It is closely allied to *C. fimbriatum*, though the colour of the flower is far more brilliant and attractive. Like it, the upper sepal and the petals are fringed all round their margins with long glandular hairs. The lateral sepals are about an inch long. The fleshy lip has two erect longitudinal keels, and is attached by a very slender bristle, the balance being so nicely adjusted that a slight touch sets the whole of the lips in the umbel oscillating backwards and forwards in a highly curious fashion. The species was originally introduced from the Philippine Islands by Cuming, and flowered with the Messrs. Loddiges in 1841. An excellent figure is given at t. 4996 of the *Botanical Magazine*. *R. A. Rolfe*.

MAKING SHAPELY TREES.

For all that has been written, how few well understand that pinching back a growing branch weakens it! Yet it is a truth that should be learned by heart, and rehearsed once a year, lest it be forgotten. Some of the most important operations of gardening depend on recognising this truth, and were I to undertake a gardening university—a college where young men should be educated to the horticultural ministry—I would have this printed or painted on the walls of the lecture-room, and possibly in the dormitories beside.

Even cutting back mature branches weakens a tree, for all they seem to grow so strong after being pruned. Look at a Willow stump annually cut back for osiers, and look at the chance one in some corner of the lot left to grow up to a tree. The branches on the stump annually cut back will make growths of 5 or even 10 feet. No such growth can be found on the mature tree. True, but the trunk of the tree may be 9 or 12 inches in circumference, while your osier stump will be but 3 or 4 inches. Or look at the annually trimmed Osage Orange hedge. The one in the corner, suffered to grow as a tree, is a tree, with a tree's glorious trunk, and the broad spreading head which a tree should be proud of; but the plants in the hedge have stems no thicker than the wrist. This tests the vigour question by actual growth; and how about longevity? Does the osier stump last as long as the Willow tree—the Osage hedge as long as the tree in the corner? Does the pollarded street tree last as long as the noble specimen on somebody's lawn? Nobody will answer affirmatively.

Everybody must know that pruning a branch really weakens it. But when we actually come to every-day practice in the garden, among our fruit trees, vines, or ornamental things, who ever thinks of it or recognises it? Here is a Grape Vine trained on a barn or a trellis, and every shoot is cut back alike. In the course of time there are a few strong

shoots at the top, the whole of the lower part naked, or with but a few weak shoots or leaves, of no use whatever from the Grape grower's point of view. Or it may be a pretty ornamental bush or evergreen tree, annually "trimmed" with shears, cutting off the head and sides; in a few years the branches have all died out below, and a bunch of twigs—crows' nests—from the summit is all that there is left of the once lovely bush. One can pass many a garden where the whole shrubbery, through this ignorant trimming, looks as if the worn-out brooms of street scavengers had been brought in and stuck about to ornament the grounds.

The good course to pursue in getting a tree or vine to be uniform, is—remembering that pinching back a growing shoot weakens it—to do this work while the growth is going on. Suppose, for instance, the shoots on a growing vine are all weakest at the bottom, and a few strong ones are pushing at the top; we should pinch these strong ones back, and take out the growing point soon after it starts, or as soon as it occurs to us that the lower branches need strengthening. If it be an evergreen that we would thicken at the bottom, pinch out the growing points of the stronger branches, but let alone the weaker ones. If it be a Pear tree that we would train to any special form, keep back the stronger branches, and let the weaker ones grow. Only in this way can we get branches where we need them.

Without a knowledge of the principles inculcated in this article, such work as this could not be done. Pruned as our people shear trees, it would not be long before every branch at the bottom would be dead, and a dozen or two at the top be all that would remain. The columnar Pear grower has to pinch back all the strong-growing shoots toward the upper portion of the tree, as the season progresses, and any shoot that seems stronger than the rest, anywhere. In the fall and winter, when the finishing time for pruning arrives, the upper part of the tree is still severely pruned. It would be an absolute impossibility to get a columnar Pear tree as our people prune, but nothing is more easy when we recognise the principle that pruning or pinching back a shoot tends to weaken it.

People may say there is no use in all this trouble to make peculiar forms of trees; that Nature does for us all and more than the Frenchman can do with all his garden skill. That may or may not be so. It is not my point to discuss this here. The object is simply to illustrate the general principle that pruning or pinching back a strong shoot weakens it, and that the weaker ones profit by what to the stronger ones has been denied. *Thomas Meehan, in "American Cultivator and Country Gentleman."*

THE ALPINE GARDEN.

THYMUS SERPYLLUM ATRO-PURPUREUS.

THE same comment as that appended on the common Alpine verna may be given to *Thymus Serpyllum*. They are both frequently met with throughout the Alps, the latter one growing on the English mountains also. The Thyme may be said to be even of freer growth yet, but on account of its pale red colour it is considered a second-class plant only. Its dark purple variety, however, is certainly an acquisition, and ranks among the finest subjects which can be planted on in the rock garden. It was found in the mountains of north England by Mr. James Backhouse, of York, together with the splendid dark purple *Saxifraga oppositifolia* var. *pyrenaica maxima superba*. This is one of the most valuable novelties the firm of J. Backhouse & Son have enriched our rockworks with. *C. Briner, New York*.

SPRING ANEMONES.

The Crown Anemone is a flower that was very popular years ago, and collections of named varieties were cultivated for exhibition purposes. Now, beautiful and useful as it is, it appears to have failed to hold a position in the public estimation. Attempts

are made to revive an interest in the flower, and thus it is we hear of Poppy Anemones, or Empress Anemones, or French Anemones.

In Holland large numbers of Anemones are grown, and they have select collections of double varieties, which come to this country in the form of dry roots in August and September, and can be purchased at a comparatively cheap cost. It is best to lift the roots after they have done flowering, and have ripened their foliage, and then place them away in drawers, or some such place, until planting time comes round again. If left in the ground they are apt to rot, and especially so if the earth be wet and cold in winter.

Among the spring Anemones should be placed *A. fulgens* and *A. apennina*. It is scarcely necessary to say much about the former, as it is now to be found in most gardens, but it is different in the case of the Apennine Anemone. For planting in borders, or in semi-wild places, I know of nothing more appropriate. It should be carefully planted in good soil, at a depth of 6 inches, and then let alone. I remember, some years ago, seeing a large patch of this Anemone growing amid the shrubs at Ealing Park, and when in full bloom it made a charming display. I think it should be planted in a fairly adhesive loam, and have a little shade in the hottest part of the day. I have a clump of it which, having been left undisturbed for a few years, has grown into a large tuft, and is an object of great beauty in spring. In common with the Crown Anemone, this species is largely grown in Holland, and the roots are sent to this country in autumn.

The old double and single scarlet Anemones are delightful border flowers also. Selections from the former have sometimes been made, but there is little real difference between them and the normal types. For cutting from, and especially for bunching for market, they are most useful. I have seen beds of them that were a gorgeous sight when in full bloom; and when concentrated in this way one gets a better idea of their attractions than when isolated plants are grown. If lovers of hardy flowers would grow a bed of the old double scarlet, planting the roots in well-prepared soil, they will admit that the result amply compensated them for any labour or expense they may be put to. *R. D.*

PRIMULA PUBESCENS VAR. NIVALIS.

This plant is also known under the names *viscosa*, *nivea*, and *pubescens alba*, though it matters little what name we adopt if we value it merely from a decorative standpoint. It is perhaps the best of the whole group of alpine Primulas, and is much prized on account of the snowy whiteness of its flowers, and the freedom with which they are produced on well-grown plants. I happen to have under my care a small batch of plants which have borne this spring from seven to eight trusses each on an average; in fact, the little group in question was a sheet of the purest spotless white, almost hiding the foliage from view, and from which I hope to get a nice crop of seed. As my mode of culture differs considerably from that of many growers of this plant I will give it in detail; it is simple, however, and very brief. Firstly, then, the time for potting: for this part I prefer the autumn, and for this reason, that it never interferes with a good crop of seed having a fair chance of ripening. But some may urge that seed bearing is calculated to weaken the plants considerably. Exactly; then let the cultivator provide his plants with nourishment suitable and sufficient for enduring the test, and rest assured that if we would increase our stock of such things by tens or by hundreds, that a unit may die out here and there even in the most skilful hands. Secondly, the best soil to employ is simply what an Auricula grower would give his plants. But I do not employ what Auricula growers do as a rule. My choice of soils are these:—Good fibrous loam and thoroughly decayed manure in equal parts, with leaf-soil and Thames grit (or any sharp grit), to about one-half of above; this makes an excellent mixture. Plant firmly, and be sure to get your plants buried right

up to the leaves, leaving no bare stem in sight, for from these stems roots are freely emitted. Have a free open drainage, and water plentifully throughout the spring and summer months; this, with full exposure to sunlight, completes my way of growing this plant. I am strongly of opinion that many alpiners perish through insufficient sunlight in English gardens, coupled with a system of coddling, and various attempts to imitate certain conditions under which they are found naturally. *E. Jenkins.*

ROSES.

NEW ROSES.

THERE were exhibited at the fortnightly meeting of the Royal Horticultural Society on Tuesday, May 8, three new Roses which I think are worthy of some more notice than that in the report of the meeting given here. Unlike those that I noticed previously, they are really seedlings, and not sports; they are of French origin, not English, and will be eagerly looked for by rosarians by-and-bye. They were exhibited by Messrs. W. Paul & Son, and attracted a good deal of attention.

Madame George Bruant.—I had already mentioned this Rose from a bloom sent to me by Messrs. Cooling & Son, of Bath, and had, I hoped, somewhat guardedly expressed my doubts as to the reality of the cross—not, of course, supposing for a moment that the hybridization had not been attempted, but that, as in many cases, no real cross had taken place, Nature in some form or other having been beforehand; but the plant exhibited showed most undoubtedly that the cross had really been effected. There was no doubt of the rugosa foliage and wood, while the flower had apparently imbibed the Tea blood; it was semi-double, and I very much question whether many will consider it any improvement on the very pretty single form of rugosa (white); but as the Japanese Rose is so very hardy, it is possible that we are on the way now to a hardy free-flowering class of hybrids, and there is no saying how far the skill, intelligence, and careful manipulation of the French raisers may take us; they will not, at any rate, give us a set of Roses which require continued replenishing, and the best blooms are only cut on maiden plants.

Gloire de Margottin has been raised by my good old friend, Margottin, of Bourg La Reine, and will, I think, be likely to keep his name first amongst rosarians for many years to come. It is a vigorous growing and most floriferous Rose, each shoot producing a flower-bud, so that it will be most valuable for forcing. We want a good Rose of this colour for the purpose, free from the dingy purplish colour of some now used for the purpose. Margottin has evidently been working for this colour. Some years ago he told me he was harking back to the times before *Géant des Batailles*, and was working on *Gloire des Rosamènes*, the most brilliant coloured perhaps of all Roses. He brought out a couple of years ago *Gloire de Bourg La Reine*, brilliant in colour, but not full enough for exhibition Roses; but in *Gloire de Margottin* we have a Rose of the build of *Jules Margottin*, but brilliant in colour. It is perhaps difficult to decide upon the value of a Rose for general purposes from a specimen grown in a pot; but we can, at any rate, decide that it is valuable for all such purposes, and from its substance and fullness I shall be very much inclined to think that it will be a grand Rose for all purposes. *Guillot fils*, to whom we are already indebted for so many valuable Teas, has added yet another Laurel leaf to his crown in the beautiful new flower exhibited by Messrs. W. Paul & Son on the 8th inst.

Madame Hoste.—I had remarked, simply from the raiser's description of it, "this sounds well." I may add now "that it looks well." It is a very beautiful yellowish-white, deeper in the centre, broad, large, and solid petal, with a delightfully short footstalk, so that it holds itself erect, as erect indeed as *Cloth of Gold Noisette*—a flower one, alas! so rarely sees. It

seems also to be robust in habit, and, like most of the Teas, free flowering.

In *Red Pet*, exhibited by Messrs. Paul & Son, we have a pretty Rose of quite another type—an enlarged form of the fairy and miniature Rose. I am not quite so sure that we shall appreciate this enlargement; the great charm of these Roses is their diminutive size, and we may perhaps not like to see this essential characteristic done away with; still it is a very pretty flower, and will be much appreciated for buttonholes.

There were other Roses at the exhibition which were well deserving of the praise bestowed upon them, although not the splendid colour of the *Maréchal Niel*; and the plants of the *Niphetos* exhibited by Mr. Walker were worthy of all praise, while the beautiful boxes of *Lady Mary Fitzwilliam* and *Princess Beatrice*, exhibited by Mr. Bennett, were very beautiful; the latter may almost be defined as a new Rose, although not one of this season, and is, I believe, classed by some amongst the hybrid Teas, and by others as a pure Tea.

It will thus be seen that the lovers of novelties need not despair of having something to gratify their taste; and it strikes me that, what with English, Irish, and French Roses, we are likely, should the season be favourable, to have a most interesting lot of new Roses to look upon in the coming Rose season. *Wild Rose.*

SPINELESS ROSES.

I find that these are by far the best for pot culture and forcing, and I shall be glad to know whether this has been noticed and remarked on before, for if not the fact is deserving of being chronicled and widely made known, as, besides being better doers, they are much more pleasant to handle when cut, and I, no doubt like many more, often wish there were no thorns to the Rose, and we might perhaps, after a time, by judicious selection in breeding, have them without. I think it will be admitted that most of them that are spineless bear the finest and best flowers, and are remarkable as well for good foliage and wood, and more particularly is this so with the perpetuals introduced within the last few years, as well as that old favourite *John Hopper*, which is still one of the most desirable kinds for growing in pots. Captain Christy has been good with us, too, and this is a Rose I can strongly recommend for forcing, as it opens well and is unique in its delicate colour. *J. S.*

NOTES FROM BELGIAN NURSERIES.

(Continued from p. 618.)

DE SMET FRÈRES, LEDENEG, are comfortably settled in the fine establishment formerly belonging to M. Verschaffelt, but which has been greatly enlarged and improved by the Brothers de Smet, who seem to inherit their father's energy. A hasty look round disclosed to our view a startling quantity of *Araucaria excelsa* of all sizes, several long spans being entirely filled with them.

The *Araucarias* are propagated by cuttings, the cuttings being placed in thumb pots filled with white sand, plunged in coarse yellow sand, and placed under a *cloche* or bell-glass, of which more than a thousand are in use. The cuttings are made in November, by the end of February they have formed thick fleshy roots. In May they are shifted into larger size pots as may be required, and in the summer months the young trees are placed under the shelter of lath houses built on the principle of the Indian "chick" houses lately referred to in these columns.

Kentias occupy no fewer than twelve span-houses, forming, as it were, one vast house, heated by 1000 metres of piping, one pipe being carried along under the roof eaves, the whole devoted to plants of a saleable size, upwards of 15,000 being planted out therein, including *K. Fosteriana* and *K. Belmoreana*, the latter having a more slender habit and narrower leaf segments. Other kinds of Palms were equally

well represented, either as small plants or as large specimens in a fine Palm-house, and a house set apart for the now inevitable *Cypripedium*, which it is hardly possible to think of as being a slighted subject in the Orchid establishments but a few years ago. De Smet Frères have begun with them successfully, and have been enabled to pick up some rare varieties, some of which were in flower at the time of our visit. *Cliveas* are also grown here in prodigious quantities. Some very fine specimens (especially of *Sweet Bays*) to be counted by the thousand, fields of *Azalea mollis*, and a large healthy and clean stock, all in marketable condition, must be recorded at this neat well-ordered nursery.

M. DE SMET-DUVIVIER, MONT ST. AMAND,

makes a specialty of *Dracenas*, green, variegated, and coloured, and possesses a very fine stock of these plants. So finely are the *Dracenas* grown that it seems a matter of wonder how such broad heads and splendid foliage can be obtained from such small pots full of soil. At the time of our visit, one of our own market growers was busily engaged in making a selection, and the numerous gaps noticed told plainly of other visitors who had found the stock good, and the prices convenient. *Aspidistras*, too, are admirably grown; and *Palms*, *Anthuriums*, and *Orchids*, are likewise specialties. Here among the *Orchids* in flower we found some good *Dendrobiums*, a batch of *Miltonia vexillaria*, *Odontoglossum cordatum*, *Calanthe Regnierii*, *Cymbidium Lowianum*, *Promeneia citrina*, *Chysis bractescens*, *Cattleya intermedia*, a distinct variety, with rose tips to the upturned side lobes of the labellum; *C. amethystoglossum*, *C. Mendelii*, *Miltonia cuneata*, some *Lælias*, and other good things, notwithstanding the fact that M. de Smet-Duvivier was exhibiting extensively and well in the Exhibition.

THE BULB GARDEN.

NARCISSUS COLLEEN BAWN.

WHAT a glorious thing this is—quite the queen of the whites, and the most graceful of the race. I had a root of it from Ireland last autumn, and it has given me four most lovely blooms. All the white *Narcissi* are beautiful, but this has an elegance altogether its own.

N. INCOMPARABILIS PRINCESS MARY.

In 1878 I had this under the name of *N. incomparabilis pallidus arantius expansus*, which I think is the longest name I ever had with a flower. In 1884 I bought it again as *N. incomparabilis Princess Mary*, a grand new variety which had received a First-class Certificate. Of course I was vexed to find that I had nothing more than "an old friend in a new dress." This is one of the most useful of the *incomparabilis* class, as it grows well and flowers freely. Another good point is that the foliage is comparatively short, and the blooms, without having long stems, are carried some 3 or 4 inches above it. The flowers are large and of fine form. The perianth is primrose; the cup is very large and conspicuous, rich yellow, sometimes stained with dull orange. This is a very fine and distinct variety.

N. J. B. M. CAMM.

This and Mrs. J. B. M. Camm are the most delicate coloured bicolors I have or know. The parson is the more perfect flower, the perianth having greater substance; but the colour of the trumpet in Mrs. Camm is indescribably soft and delicate, and the flower is somewhat drooping, which habit seems to add to its beauty. The parson grows fairly well but the lady certainly has the better constitution.

CHIRONDOXA LUCILLE ALBA.

In 1885 I was delighted to find a root of this among some imported bulbs. It has a dwarf sturdy habit, the flower is large and of good substance, and

brilliantly white, with delicate lavender tints on the back of the petals. There is something unique in its appearance which leads every one to ask, "What is that lovely flower?" I am raising seedlings from it, hoping that some of them may come true.

FRITILLARIA MOGGRIDGEE.

Here we have a spring beauty, which ought to find its way into all our gardens. The large flower is carried on a stem not more than 6 inches high; the colour is yellow, with reddish-brown markings. Altogether, it is a very striking plant, and seldom fails to gain attention from those previously unacquainted with it. It is thoroughly hardy, but does not appear to increase very fast. Last season I saved some seed, which is now coming up nicely, so I shall have a good stock by-and-by, but I do not know how long the *Fritillarias* take to reach the flowering stage.

PUSCHKINIAS.

How very seldom these are seen in ordinary gardens, and yet they can be bought at a reasonable price, are perfectly hardy, easily grown, and have a chaste beauty entirely their own. I have had a good many seedlings bloom this spring, but they do not vary much from the two types—the one with violet-blue stripes, the other with smoky-black lines. One of my seedlings has a head of bloom as compact as that of *Orchis maculata*, the colour of the flowers being normal. *Scilla puschkinoides* may also be mentioned for its quiet beauty, but lovers of showy plants will not care for it. These twilight tiats are very refreshing after the noontide splendour of the *Daffodils*.

ALLIUM PEDENONTANUM.

In 1879 I bought a root of this, and planted it in the open border, in soil composed of river grit and loam. For some years I thought it a greatly over-rated plant, and was not at all surprised that it was now seldom mentioned. Last summer I found that it had grown into a large clump, with more than fifty trusses of bloom on it. This mass of rosy-purple drooping flowers was very charming. *Jay Ayr.*

BOOK NOTICE.

FLORA OF THE HAWAIIAN ISLANDS.*

The vegetation of no part of the world is more interesting than that of the chain of remote islands familiarly known to English people as the Sandwich Islands. These are now often designated as above, from the name of the largest island of the group, where Captain Cook fell, and which he called Owhyhee. Menzies, Macrae, and Douglas, our own countrymen, were among the first to make known the botanical peculiarities of these islands; but the comparatively recent fuller investigation has been the work of Americans and Germans. The book before us contains descriptions in English of all the vascular plants known to the author, a German, who himself resided in various parts of the islands during a period of twenty years. Unfortunately Dr. Hillebrand did not live to see his own work through the Press, and the part relating to the distribution of the plants, and the physiognomies of the vegetation was left in a manifestly incomplete and fragmentary condition.

The Hawaiian Islands in mid Pacific are the most distant from any continent of any group of equal extent, being upwards of 2000 geographical miles from America, and further from Australia and Asia. Apart from islets, they are about a dozen in number, lying just within the tropics and forming a chain with a north-westerly direction, from Hawaii, the largest island. The total area has been estimated at about 6000 square miles, and the volcanic mountains are extensive and lofty, the highest, according to Hillebrand, being Mauna Kea, which is 13,805 feet high.

"A single day's march will carry the traveller from the tropical heat of the coast to the region of perpetual snow, and in crossing the breadth of an island he may pass from a climate with an annual average rainfall of 150 inches to one of 30 inches or less. In contrast to this diversity in temperature, moisture, and barometric pressure stands the uniformity of soil, which is derived almost entirely from the decomposition of basaltic rock, there being only a narrow band along the coast, in some regions, formed from coral limestone. The ground is generally pervious, so that the rainfall is soon absorbed. Only in the lowest and broadest valleys, and the adjacent flat coast region, and on some of the table lands of the oldest form, where deauration has long been active, and the water retained. In the valleys a heavy retentive clay forms the surface, and affords a suitable bed for the cultivation of Tara and Rice. On the high table-lands of Kanai and West Mani, and also in one or two parts of Molokai, a thick layer of mosses, Liverworts, and Sedges covers the moderately heavy soil; being within reach of perpetual clouds, and continually dripping with moisture, it has increased to beds of turf, and forms extensive bogs, the habitation of many of the rarest plants."

Dr. Hillebrand's book contains descriptions of 844 species of flowering plants, belonging to 335 genera, and 155 species of vascular cryptogams, belonging to thirty genera, making a total of 999 species and 365 genera. Of these 860 species are regarded as indigenous, and 653 of them are apparently absolutely peculiar to the islands; this is nearly 76 per cent. of the whole; but although a very high proportion, it is exceeded in Western Australia, where there is probably the greatest concentration of endemic forms in any part of the world, by about 9 per cent. There are also about forty genera not known to be represented in any other part of the world.

But it is not so much the proportion of peculiar genera and species, as their complex affinities with those of other parts of the world, that puzzles the student of the general distribution of plants. Other remote islands, notably St. Helena, present the same problem, more especially in relation to the probable origin of the Composite, which largely preponderate.

In the Hawaiian flora we meet with an admixture of forms whose nearest relationships are partly Mexican and South American, partly Australian, and partly Malayan and Polynesian generally. Prominent in the first category are the numerous shrubby Compositæ related to *Madia*, *Stiftia*, *Wunderlichia*, and other genera known in cultivation. Then there are the numerous shrubby and arboreal Lobeliaceæ belonging to four or five endemic genera, whose nearest connections are the Andine *Burmeistera*, *Centropogon*, and *Siphocampylus*. Hillebrand defines about fifty species of this group, some of which are trees 20 to 40 feet high, the majority, however, being of smaller dimensions, though of arboreal habit.

The Australian element is conspicuously represented by the genera *Metrosideros* and *Acacia*, the species of the latter having their leaves, like the great majority of the Australian species, reduced to rigid expansions of the petiole, and commonly called phyllodes in botanical language. These are the commonest forest trees in all the islands, but the demand for timber has greatly reduced this element in the vegetation, which is being to some extent replaced by the more rapid growing introduced Australian Gum trees (*Eucalypti*). Among other genera of Australian affinity we may mention *Cyathodes* (*Epacridæ*), and *Exocarpos* (*Santalacæ*).

Cyrtandra (*Gesneracæ*) is a noteworthy example of the Malayan and Polynesian type, being represented by about thirty endemic species. In this connection it should be mentioned that Hillebrand overlooked Clarke's monograph of the *Cyrtandracæ*,* and has redescribed many of the species under other names.

The vegetation of the sea-shore includes a considerable number of plants common to the maritime districts of the Old World, from Eastern Africa to the Hawaiian Islands; such are *Paritium tiliaceum*,

Morinda citrifolia, *Cordia subcordata*, *Ipomœa pes-caprae*, and *Pisonia inermis*.

A word or two in conclusion respecting the peculiar element, apart from its relationships. As in many other insular groups, the woody element preponderates, especially in the drier exposed districts, and it includes many curious and rare species. Among them shrubby species of *Lepidium*; the genus *Schiedea* and *Alsinodeadron* (near *Silene*); shrubby *Geraniums* up to 12 feet high, with a stem 4 inches thick; a *Plantago* with an unbranched stem rising to a height of 6 feet, and a *Dock* (*Rumex*), which in the forests grow up among the trees 20 to 40 feet; *Phylostegia* and *Stenogyne* (*Labiata*) abound in species, many of them growing widely over other shrubs. One of the greatest difficulties in dealing with the flora is the excessive tendency to variation exhibited by the endemic element, so that a satisfactory delimitation of the species is, in some cases, impossible.

With regard to the manner in which Dr. Hillebrand has acquitted himself of the task, practical use of his book alone can afford a sufficient test; but it has the appearance of being well done; and the printer and publisher certainly deserve praise. *W. B. Hemsley.*

ERYTHRONIUM HENDERSONII.

This is a new species, fig. 86, found last April for the first time near Ashland, Jackson County, Oregon, and also at Grant's Pass, Josephine County, and described in the *Transactions of the American Academy* by Sereno Watson. It is certainly the finest of all the Dog-tooth Violets, and as it appears quite as hardy as the others it is sure to become a general favourite with growers of these plants. The leaves are sparingly mottled, the stem 4–6 inches in height, one to two-flowered, and probably more as the roots increase in strength, the petals spreading and recurved, about 2 inches long, pale purple or lilac, with a very dark purple centre, surrounded by a narrow strip of pale yellow. The inner segments have an auricle at the base above the short claw, and this is the most important distinguishing feature. It has been flowering in the alpine-house at Kew, and we believe a figure has been made for the *Botanical Magazine*. Another pretty species, and one equally easy to grow, is *E. americanum*. It belongs to the solitary flowered section, flowers large, a fine soft yellow, sometimes spotted at the base. *E. albiflorum* is also worth cultivating. It is a variety of the handsome *E. grandiflorum*, with large white flowers, orange and yellow at the base. It has been figured as *E. giganteum*. *E. purpurascens* is very fine, the light yellow flowers tinged with purple, and deep orange at the base. The most curious of all, however, is a species called *E. propullans*. It was found in Minnesota, the offshoot proceeding from the stem near the middle; the flowers are small, bright rose, yellow at base. I believe it is not yet introduced. *D.*

PLANT NOTES.

CLERODENDRON CEPHALANTHUM.

This is a new species of *Clerodendron*, which was brought to Kew from Zanzibar in 1886 by Sir John Kirk. It is a stout fast-growing climber, with brown stems and large ovate dark green leaves as much as 1 foot in length. The petioles are remarkable on account of their hardening and forming stout hooks, which apparently assist the plant in climbing. These hooks curve downwards, and from their apex the soft herbaceous part of the petiole turns upwards again. The flowers are either collected in a dense head on the ends of ripened shoots, or they are in smaller axillary heads on the uppermost foot or so of the young branches. The calyx is large, 5-lobed, purplish, and the corolla is composed of a long narrow tube 4 inches long, and divided at the top into five spreading segments, with the twisted stamens and stigma 1 inch or so longer. The tube is greenish-white, and the limb or segments creamy-

* *Flora of the Hawaiian Islands*: a description of their Phanerogams and Vascular Cryptogams. By W. Hillebrand, M.D. 8vo, p. p. 673, with a frontispiece and maps. London: Williams & Norgate.

* De Candolle's *Monographie Phanerogamarum*, vol. v.

white. It is a handsome plant, worth a place in large stoves, and it is apparently very easy to manage. Its nearest ally is *C. capitatum* of *Bot. Mag.*, t. 4355, but it is a better looking plant than that species as represented in the plate quoted. *C. cephalanthum* is now flowering in the Palm-house at Kew.

BOUGAINVILLEA SPECTABILIS.

This grand stove climber is not often flowered in England, but at Kew this year it is a success, every branch on a large specimen bearing clusters of brilliant purple-rose flowers, or more properly bracts. Evidently the way to manage this plant, so as to

Buglosses which are found in the Canary Islands. There is a large example of it in the temperate-house at Kew now bearing numerous erect spikes of fiery purple flowers, the spikes measuring nearly a foot in length by some 3 inches in width. For large greenhouses this gorgeous plant may be strongly recommended, as it flowers annually, and its large spikes of bloom remain in perfection for a month or more.

DISA RACEMOSA.

generally known as *D. secunda*, is now flowering finely at Kew. It is quite a first-class Orchid, and being apparently as easy to manage as *D. grandiflora*

have already commenced preparations for swarming by constructing queen cells, it is difficult to prevent them. Sometimes it may be effectual to cut out queen cells, but we have known cases where that has been done and the bees have nevertheless swarmed almost immediately after having commenced about double the number of queen cells before doing so. I forget who it was said that "bees do nothing invariably," and it is very true; therefore a wise beekeeper will be prepared for every and any antic the bees may get up to. It must be remembered that though the days are warm the nights are still cold, and therefore all must be kept warm and snug at night that the brood may prosper.

If, instead of swarming (which in some cases is devoutly to be wished), the bees take to the supers, it is reasonable to suppose that a good surplus may be obtained. When the bees have made some progress—*i.e.*, about half-filled the sections—put another lot under, and the bees will then work in both at the same time. A third may be added in like manner, still under, if honey is freely coming in, and the bees will then quickly finish off the top and work downwards. As soon as the top ones are well sealed they can be removed, and so the work may go on. Thus the bees may be kept at work and the surplus removed without any injury to the bees. If hives are thus worked, it is a good thing to leave the bees a little time to themselves before the honey flow ceases, so that they may be well supplied themselves. This is done in Poland with very great success, and there, we believe, feeding is not much resorted to. Another reason why bees should be supered early is because the early honey from honey blossoms is very good indeed and is generally liked more than later honey, except, perhaps, that gathered from Clover. *Bee.*

FIG. 86.—ERYTHRONIUM HENDERSONII: FLOWERS LILAC WITH A CENTRAL PURPLE BLOTCH EDGED WITH YELLOW. (SEE P. 652.)

bloom it, is simply as follows:—Plant in a bed where the roots will be restricted, and where it will be easy to get the soil in the bed quite dry. Train the shoots near the glass where they will get full sunshine. Syringe and water freely all through the growing season. From October to February withhold water entirely. In March loosen the soil, top-dress with good manure, and water freely. The flowers should now show. Thin out, and prune the shoots after the flowers are over. This is briefly the treatment which has proved successful in the management of this plant at Kew.

ECHINUM CALLITHYRSUM,

better known under its garden name of *E. arbo-reum*, is the largest and handsomest of all the giant

it ought to become a popular garden plant. The figure of it in the *Gardeners' Chronicle* lately (see p. 593) gives an excellent idea of the flowers. The Kew plants were exhibited at the meeting of the Royal Horticultural Society at the Drill Hall on Tuesday last.

THE APIARY.

THE weather at present is everything that might be wished for the prosperity of our bees. If a reasonable amount of food were given in the cold weather there will now be brood in all stages of development. If swarming is to be prevented supering ought to be done at once, but if the bees

TREES AND SHRUBS.

SHRUB FOR SLOPE.

I DESIRE to draw the attention of your readers to a plant which has recently been introduced into some of the "hill stations" (as they are called) in the Himalayas for the purpose of clothing sloping banks. It was first brought down from the snowy altitudes of the range by the late Colonel Gaistin, of Almora, and since then I have personally taken some pains to utilize it, with considerable success. The clothing of our somewhat steep slopes is in the Himalayas of some difficulty. Grass will not grow satisfactorily except at 10,000 feet and upwards. From 6000 to 8000 feet, which is the altitude of our chief hill stations, grass is dried up by the three months drought, sometimes extending to four or five months between the winter snow and the rainy season, *i.e.*, between February and June, during which period sometimes not even a drop of rain falls. The plant in question is the *Rubus nutans*, or, as it is now popularly called with us, the Creeping Raspberry. Although brought from the region of the snows, above 10,000 feet, it will stand the sun at 7000 and 8000 feet admirably, probably on account of the shade afforded by its leaves to the roots. Its foliage dies off in the late autumn, but the new leaves and shoots begin to appear very early in the year, even under a considerable depth of snow. Thenceforward, throwing out a root at every joint, it proceeds to spread with amazing rapidity, and eventually covers the slope on which a few roots have been planted with a strong network of vegetation, killing out all weeds, and fastening the soil with so firm a grasp that the torrents of the rainy season have no appreciable effect upon it. It has in the earlier months of the year a refreshing spring-green appearance, due to the young shoots, and in the later months a warm autumn colouring. At all times it gives the effect of a rich carpet of vegetation of a Strawberry character. Beyond a little surface manuring in December it requires no labour or attention. I send by this mail a photograph of a slope close to my house near Simla, which will give you some idea of the general

character and appearance of the plant. I could send a few roots in the winter to anyone wishing to try it. *E. C. Buck, Bengal Civil Service.*

RIBES CEREUM.

The figure of this plant in the *Botanical Magazine*, t. 3008, gives but a poor idea of the beauty of the shrub. It was introduced for the Horticultural Society by Douglas in 1829, but is not much known. It is of low growth, and the delicate waxy pink-lilac flowers are very attractive in the Ribes bed at Kew just now. In the figure cited the flowers are figured as greenish-white, but in the living plant they are far more attractive.

THE CINERARIA.

Over a century has lapsed since the introduction of this valuable decorative plant, and how great has been the improvement during this period may be inferred from the annexed figures (fig. 87, p. 657), of which *C. cruenta* has been prepared from plants flowered at Kew during the present spring, from wild seed from the Canaries, while the types of cultivated forms have been kindly supplied by Mr. James, and by Messrs. Cannell. So different is the species, both in habit and appearance, from the superb strains now in cultivation, that unless we had actual historical evidence of their descent, we might almost doubt whether the one could have been directly derived from the other. These wild plants varied from 3 to 5 feet in height, the habit was quite lax, the heads of flowers small, and with few (generally eight) ray-florets, the colour lilac: and they formed a really elegant and graceful group as they stood on the floor at one end of the greenhouse. The descendants of this wild stock are dwarf and compact, with large heads of flowers of the most various shades of colour, and including a series of so-called double forms of almost faultless shape. A glance at a series of these superb varieties, illustrates the survival of the fittest according to the ideas of the florist—a century of careful selection of the most decorative forms.

Cineraria cruenta was originally introduced to Kew by Mr. Francis Masson, in 1777, from the Canary Islands. There it grows on the north side of the Peak of Teneriffe, in what has been called the intermediate zone, and which is said to extend from about 1500 to 5000 feet elevation on the mountain. It appears to be quite local as a wild plant. Lindley describes it as "inhabiting groves of Laurels, Myrica, Faya, Arbutus, Heaths, Flex, and other shrubs, among which the Sweet Chestnut and downy-leaved Oak are naturalised, and associating with species of *Convolvulus*, *Ranunculus*, *Rubus*, *Geranium*, *Strawberries*, *Violets*, and similar plants. In these regions the air is moist, the sky is almost always overcast with clouds, especially during the day, while in the summer time fogs and mists are common, and in winter storms and heavy rains; there is no frost, and when snow falls upon the upper limits of the zone it melts immediately. The surface of the country is broken up into valleys and mountains, and the soil, though volcanic, is well covered with mould."

It is interesting to be thus able to picture to ourselves the plant and its native surroundings, and these conditions of climate, so different to the dry atmosphere of the lowlands of the Canary Islands, serve to explain the conditions under which it has been found to succeed best under cultivation. Judging by notes attached to wild specimens in the Kew Herbarium, it would appear to range from about 2500 to 4100 feet elevation, thus occurring in the very centre of the intermediate zone, but not at its upper and lower extremities.

It is somewhat curious to note that *Cineraria cruenta*—the *Cineraria par excellence* of gardens, and long likely to remain so—should not be a *Cineraria* at all, but such is the fact. *Cineraria* is a small genus of somewhat over twenty species, located at the Cape of Good Hope, with a solitary outlier in Madagascar. It differs from the world-widely dis-

tributed *Senecio* by very slight characters indeed—simply in having a flat not a rounded seed-vessel. The plant under consideration is a *Senecio*, unfortunately—the *S. cruenta* of De Candolle; though from the fact of its having been originally called a *Cineraria*, a *Cineraria* it is likely to remain, so far as gardens are concerned.

There are several old figures of the plant, and these show the colour as purple, while all the Kew plants were lilac. *C. lactea*, Jacq., *Eclog. Pl.*, t. 105, simply represents a white variety of the same, and thus it seems probable that even as a wild plant there may be some variation of colouring. These figures are:—*C. cruenta*, L'Herit., *Sert. Angl.*, t. 33; *Vent. Malin.*, t. 93; *Bot. Mag.*, t. 406; *C. aurita*, Andr. (not L'Herit.), *Bot. Reposit.*, t. 24; *Senecio cruentus*, DC., Lindl., *Bot. Reg.*, xxv., t. 7. In the *Phytographia Canariensis* it appears as *Doronicum cruentum*, Schultz. Bip., in the text (vol. iii., p. 336), and as *Pericallis cruenta*, Webb., on the plate (t. 104). Lastly may be mentioned that most of these figures represent more ray-florets to each head than the one now figured here (fig. 87), which appears to be a truly wild type in the fullest sense of the word. *R. A. Rolfe.*

FORESTRY.

BARKING OAK.—A few years ago the value of the bark was a considerable factor in fixing the price of a standing lot of Oak, now the cost of stripping approximates so closely to the returns obtainable, that practically it makes little difference whether the timber is sold standing or felled. A proof of this is the fact that the quantity of Oak barked each year seems on the decrease. During the past winter I have seen on many estates a quantity of fine Oak felled, which, under the conditions existing within the present decade, nobody would have thought of cutting before the spring. Personally, in spite of what is said in favour of winter-cut trees, I prefer Oak stripped in the ordinary way, but this perhaps is a mere matter of opinion. A more interesting question, especially as we are now in the height of the barking season, is how far the practice of spring felling and saving the bark can be carried on with a fair prospect of making the two ends meet, or securing a moderate profit. It is certain that proximity to a tanyard is a great consideration, as cartage is generally a very large item; still, speaking broadly, I take it that there is a tolerably clear rule which may be followed; and that is, that field and hedgerow trees should be thrown without waiting for the bark, but in the case of woods or coppice timber the bark should be saved. As I have said above, accessibility to a tanyard is of great moment, and when field or hedgerow trees are within easy distance they may yet occasionally be barked at a small profit. This, however, will not alter the general line I have laid down. The reasons are, that coppice-grown bark is appreciably more valuable than field bark, and that in woods and coppices there is none of the inconvenience and damage attendant upon felling trees about the fields late in the spring. In deciding upon felling in woods and coppices, it is a recognised rule to first of all clear the underwood during the winter. I speak now of estates where something like a regular system is adopted, as in not a few cases lately I have seen trees being thrown into tall underwood. This of course is a most wasteful plan. I repeat, then, that where the underwood has been cut and cleared during the winter, the felling of what timber is proper during the spring, and its subsequent removal during the summer, does little or no harm, and is the class of trees upon which the practice of bark stripping will hold its own the longest. With hedgerow and field trees the conditions are entirely different, and so long as prices remain at the present low ebb, it will be quite as advantageous to fell during the winter and lose the bark. The bark itself not being so valuable—at least this is what tanners always maintain—is one reason, but the chief is the damage which is bound to result to crops. Every one who has had the management of work of this sort must know, that felling trees with spreading branches—and field trees are not generally devoid of branches—just at the season when grass and other crops are beginning to grow luxuriantly, is bound to cause trouble

with the occupiers of the land. Damage is simply unavoidable; so even if the stems of the trees are left until after the hay or corn harvest, as the case may be, it is essential that the bark, and also the top-wood, be carted away within a week or two of the time of felling. A waggon and two or three horses crossing a meadow of mowing grass, or a field of growing corn, is not a small matter. When, however, there was a margin of £2 or £3 per ton on the bark, these difficulties had to be arranged in the best way possible; but now, as I have pointed out, the profit is so small as to make it doubtful whether any at all will remain; it is in the majority of cases better to arrange for the felling of hedgerow and field Oak in the winter season, and confine the barkers to the woods and coppices. *D. J. Yeo.*

PLANTS AND THEIR CULTURE.

INSECTIVOROUS PLANTS.—Under this general heading several interesting genera of plants may be placed:—*Drosera*, *Dionaea*, *Cephalotus*, *Sarracenia*, *Pinguicula*, and *Darlingtonia californica*. These curious plants take up but little space, are easily managed, and never fail to interest. They are subjects of easy culture, provided a few leading principles receive attention. Seeing that they are all more or less "bog plants," it will be necessary to imitate somewhat the conditions of a natural bog in which the plants grow but slightly above the water-level; but their position in a house is very different, as in a glass-house, where a pot or pan is filled with soil and water and planted with these plants, the water would quickly become impure, thereby poisoning the roots of the plants; whereas under natural conditions the water would be, by reason of its bulk and natural outlet, always in a state of movement and constant renewal, and never become inimical to plant life through lack of the necessary aëration. It is, therefore, evident that a bog soil through which water can percolate freely affords a condition favourable to the growth of these plants. Lumpy peat, with bits of living sphagnum moss, just sufficient to quite cover the surface of the soil, after a little growth has been made. *Cephalotus* is partial to pieces of white sandstone added to the soil, good drainage, a moist atmosphere, plenty of light—indeed, direct exposure to the sun is good for them; they should also be frequently syringed—twice daily in summer; a fair amount of ventilation with greenhouse temperature are conditions suited to their well-being. A good way to maintain the necessary moisture around them is to plunge the pots or pans in which they are growing in a bed of sphagnum moss, but if the pots be small, or there are but a few of them, it is better to plunge several together in a box or pan, this will much reduce the risk of their getting dry. The best time to re-pot, is just as they are starting into fresh growth, which they do at various seasons of the year, but spring and early summer are generally the best periods for the operation.

Cinerarias.—A large sowing should now be made, using a compost of leaf-mould, loam, and sand in equal proportions. Sow thinly, and cover lightly, placing the seed-pans in a cool frame which does not require much shading. This will be found to be better than having to use much shading, which causes the seedlings to become spindly—a very undesirable result. Doubles which have gone out of flower should be cut down, and be placed in a suitable growing temperature in order that cuttings may be obtained later. Prick off earlier sown batches, using a free rich soil—placing them in a moist cool position. *F. Ross, Pendell Court.*

THE ORCHID HOUSES.

THE high temperature which it is now necessary to maintain in Orchid houses containing natives of the tropics will lead to increase of the numbers of insects, the same thing occurring in the cool houses. It is well to mention that thrips have a great liking for *Miltonia Roezlii*, but if water be syringed down into the growths and axils of the older leaves once a day it will drive them from their hiding-place, and make it uncomfortable for them, so that they will not do much harm. If the insects cannot be kept under by cleaning the plants separately, it will be better to fumigate with tobacco, before doing so placing the tenderer plants in another

house. Long experience only will decide which will withstand smoke and which will not. Sometimes it happens that one grower can fumigate certain Orchids with safety, while another will come to grief over the same species. Probably this difference arises from the latter growing his plants too soft by employing heavier shading, and affording too little ventilation. Many species might be mentioned which are impatient of tobacco smoke, in some cases the old foliage is affected more than the young growths, and *vice versa*; and it will be found that most of the *Coleogynes* and *Calanthes* are very tender, also *Phaius*, *Pleiones*, *Utricularias*, *Pachystoma Thomsonianum*, *Dendrochilums*, *Colax jugosus*, some of the *Zygopetalums*, *Odontoglossums*, and *Masdevallias*. Any plants which may be suspended near the roof will be found more likely to get injured by smoke. Some *Dendrobies* receive a severe check in this way when the pseudobulbs are partly made, their leaves being shed and the growth arrested, under which circumstances a new break will form, and which generally finishes much under its normal size. While growing, make sure that the plants are kept moist at the roots, and the foliage is dry before commencing to fumigate. Any large specimens that are likely to get injured by smoke and are not easily transferred to another house, can be made safe by covering them with a piece of tiffany. *C. Woolford, Downside, Leatherhead.*

THE FLOWER GARDEN.

BEDDING OUT.—The time has now arrived for this work to be taken in hand in gardens wherever possible. There are so many different ways of filling flower beds in the summer, and the subject is to many so important, that the whole of our remarks this week will be devoted to it. As there are three or four methods, so to speak, of summer bedding coming under different appellations, perhaps it would be as well to treat of each separately, and we must here say that the space at our command will not admit of lengthy details.

Mixed Bedding.—Within the past few years this has come into much favour, and deservedly so, for there can be no question that beds planted with a variety of plants are more interesting than if it contained but two or three. Hardy perennials may be made to play an important part in this method, and assuming that a bed is planted with a suitable selection, it need not be without flowers of some kind or other during eight or nine consecutive months. Such beds, however, are rendered additionally attractive in the summer time by having planted at intervals of a few feet some of the more gorgeously coloured tender species, particularly of those kinds whose beauty mostly consists in their foliage. For instance, we may have a large bed, the centre row of which consists of such hardy species as *Solidago canadensis*, *Papaver bractentum*, *Oenothera grandiflora*, *Bocconia japonica*, and *Verbascum nigrum*; in the same row and at about equal distances space should be left for planting out in June clumps of *Cannas*, preference being given to the dark-leaved varieties, with a plant or two here and there of *Grevillea robusta* or *Amaranthus salicifolius*; the second row might contain *Anemone japonica alba*, *Aster Amellus*, *Chrysanthemum arcticum*, *Lychnis chalcidonica*, *Iris Kämpferi*, *Phlox* of florists' varieties, and *Pyrethrums*; in this row might be planted in June again, *Zea japonica*, variegata, *Solanum marginatum*, or *Melanthus major*, at intervals; in the third row could be planted—*Geum coccineum*, *Aquilegia chrysantha*, *Stenactis speciosa*, *Rudbeckia Newmaniana*; and to these may be added such handsome foliaged plants as *Chilian Beet* and *Solanum pyracanthum*. The outside row might consist of a broad band of *Stachys lanata*, or *Dactylis glomerata variegata*. It must not be supposed that such a bed would present an attractive appearance for more than four or five months, but so planted it would have a far more telling effect than if hardy perennials alone were grown. This system is quite unsuited and altogether out of character in small geometrical beds with Box edgings, &c. In the latter case the more suitable subjects will be found in a different class of plants, and if good taste is brought to bear on the matter some very pleasing combinations of both flowers and foliage may be obtained. The following may be named as examples, viz.—*Silvery-leaved Pelargoniums* with blue *Viola*, or Purple King *Verbena*, margined *Fuchsia Golden Fleece*. Another pretty arrangement will be found in *Abutilon*

niveum maculatum, interspersed with *Colens Verschaffelti* and *Verbena venosa*. Again, dwarf blue *Ageratum*, variegated *Veronica*, and scarlet *Tropeolum* go well together. The effect of such beds is greatly enhanced by having in the centre such graceful plants as *Dracena congesta*, *D. australis*, and other similar subjects.

Carpet Bedding.—To many persons this style of flower-bed filling is becoming monotonous, which effect perhaps arises from the ways of bedding out. Notwithstanding this fact, there is much about it that is admirable, and there can be no question about the hold it has upon the taste of the public at large; still, for all that, I think the time has arrived when some new ideas should be transfused in some form into its methods, and in one particular this may easily be done. In the majority of cases it is the practice to have the beds of one level, viz., about 6 inches above the grass, but this may be improved considerably by having three distinct levels, where the length and width of the beds will admit of its being done. We have two beds 24 feet by 8 feet on which the practice we are now advocating is being carried out this year; but perhaps I shall best explain my meaning by saying that each bed is formed in a series of terraces; the first level is 6 inches above the grass, the second and third rise one above the other at that height, so that when complete the top of the bed is 18 inches above the level of the lawn; the sides of each elevation are planted with *Sedum lydium* and *Echeveria secunda glauca*; the remaining portion of the beds will be planted in due course with *Alternantheras*, *Mesembryanthemum*, golden *Pyrethrum*, and other plants. This, of course, can only convey a rough idea of their general appearance. No work of this kind is complete without such plants as *Chamaepeuce diacantha*, *Dracenas*, dwarf *Palms*, and other plants of a similar character interspersed over the surface of the beds at regular distances. Many kinds of succulents may also be used in the same way with great advantage. Carpet bedding would doubtless have died out long ago if it had not been for the introduction into the beds of such plants as these.

The Grouping of Colours.—A quantity of bloom of one colour in a single bed finds favour with many persons, and I give the following list as being suitable for the purpose, the second named plant in each case being used as an edging or narrow margin to the first, viz.—Yellow *Calceolaria* with *Iresine Lindenii*, scarlet *Pelargonium* with *Centaurea candidissima*, Purple King *Verbena* with *Stachys lanata*, pink *Pelargonium* with *Colens Verschaffelti*, blue *Ageratum* with *Cerastium tomentosum*, &c. When a number of beds are grouped together, as frequently is the case, and when all are in view from a given point, arrangements should be well considered beforehand, and care must be taken not to plant beds which are in juxtaposition with colours that kill each other; aim rather at contrast or harmony of colour, the latter being considered the more pleasing.

In certain parts of a flower parterre raised mounds of a small size may be planted with such plants as *Pelargoniums* of strong growth, Ivy-leaf varieties being very suitable; *Vitis heterophylla*, *Heliotrope*, *Lantanas*, golden, silver, and other variegated *Ivies*. But this kind of planting must be used sparingly, or the parterre will have a spotty appearance. *J. Horsfield, Heytesbury.* [Standard *Cassia corymbosa*, *Heliotrope*, scarlet *Pelargonium*, are permissible in certain positions near the mansion, and when vigorous and full of bloom they look very well, and are a departure from our usual way of doing things. Ed.]

FRUITS UNDER GLASS.

MELONS.—Where fruits are colouring, discontinue the use of water and the syringe, and maintain a warm atmosphere, so as to secure a high flavour, and do not cut the fruit until it is well cracked round the stalk, unless they are intended for market purposes or to be kept for several days. Melons being always best when allowed to hang on the vine until the flavour is quite up, and should then be put on ice to cool before being sent to table. If a Melon be kept a day beyond the proper time the flavour is more or less deteriorated. Attend to the pinching, training the shoots, and the fertilisation of blooms on successive plants, making fresh sowings of seeds about once a fortnight, for no matter how many sorts are grown in a house or pit, unless a proper succession of plants be kept up, there will be sure to be a gap in the supply of fruit.

Melons may be very successfully managed in pots and boxes set above the hot-water pipes. A good plan is to grow the Melon plant on in 6 or 7-inch pots, and then stand the pots with the plants on the top of pots 12 or 14 inches in diameter, filled to a depth of three parts with loam; into this the plants will speedily find their way, and a good crop of fruit may be secured in plant and other houses where a suitable temperature can be maintained.

Cucumbers may now be grown out-of-doors with little labour where a box with a spare sash or two can be secured, with a depth of 2 or 3 feet of any kind of fermented straw or leaves, and the Cucumber-house can then be put to some other purpose, or be thoroughly overhauled and repaired. Plants which have borne fruit for some considerable time may show signs of weakness. Where this is apparent crop lightly for a time, encourage the young shoots to grow, and pinch off the bulk of the fruit as it appears, also the male blossoms; top-dress with horse-droppings, leaf-mould and loam, with a liberal quantity of Vine manure in it, and keep the foliage clear of greenfly and red-spider by the use of the syringe.

Strawberries will now demand a large amount of water, in order to keep the plants clean and healthy; where fruit is colouring keep the ventilators open as much as possible, and syringe heavily those plants which are swelling their fruits up to the time of their showing signs of ripeness, when no more syringing must be done. Where a Strawberry-house is at command, Strawberry plants are unwelcome tenants in other fruit-houses. Any plants which still remain out-of-doors will now advance sufficiently fast when put into cold-pits or frames, and these will not require so much watering as those on shelves in airy houses. *Wm. M. Baillie, Luton Hoo.*

THE HARDY FRUIT GARDEN.

STRAWBERRIES.—The flower-spikes have now pushed up rapidly, and on warm borders are already beginning to expand, and on old plants many are thinned somewhat. When a few early Strawberries are required before the time they will naturally ripen outdoors, they may be obtained by placing a frame over some plants that are well furnished with bloom. By this means the ripening of the fruit will be much hastened. Abundance of air must be given during the time the plants are in bloom, and liberal waterings at the roots when the soil is dry, closing the lights late in the afternoons with a certain amount of sun heat. Although rain may have fallen in parts of the country, it has not been sufficient to soak the ground, so that Strawberries which are grown on dry soils will derive great benefit by having a thorough soaking of water before they commence to bloom, afterwards giving another thorough watering to carry the plants over the pruning period. The early forced plants of *Vicomtesse Hericart de Thury*, which will be required to fruit again next autumn, must be carefully attended to with water, and be syringed occasionally, until they can be removed to the open ground prior to being planted out. The same remark also applies to all other forced plants which are intended for planting out to form new plantations. Generally speaking, these plants have to wait till a piece of ground is cleared of an early crop before they can be planted out, hence particular attention should be paid to the details mentioned.

Disbudding.—Continue to disbud Peach and Nectarine trees, and in the case of the young shoots which have fruit at their base, pinch them back to three or four buds. The fruit having now set, the trees should receive a washing with the hose or garden engine; and if this practice be followed up it will help to keep down aphides and spider, and tend to healthy growth. *A. Ward, Stoke Edith Gardens, Hereford.*

HOOPER & CO, LIMITED.—At the annual general meeting of shareholders in this company, the Chairman (C. A. Hooper, Esq.) explained that the business of the company was in a satisfactory condition, that after deducting all the salaries and the expenses of management, there remained a nett profit upon the capital for the six months ending December 31 last of about 9 per cent.; a dividend at the rate of 6 per cent. per annum was declared, the remainder being carried forward. A branch establishment is to be opened in Paris, and another shop has been secured in connection with the present one in Covent Garden Market.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

SHOW.

FRIDAY, JUNE 1 } People's Palace, London, E.: Spring Show.

SALES.

MONDAY, MAY 28 } Imported and Established Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms.

TUESDAY, MAY 29 } Orchids in Flower, at Protheroe & Morris' Rooms.

THURSDAY, MAY 31 } Imported and Established Orchids, at Stevens' Rooms.

FRIDAY, JUNE 1 } Second Portion of the Bromfield Collection of Orchids, at Protheroe & Morris' Rooms.
Imported Orchids, at Protheroe & Morris' Rooms.

Market Gardening Round London.

THE market gardener, like the farmer, is getting at his wits' end to know what crops to grow which will pay. Both are face to face with excessive competition and low prices, and both are asking what is best to be done. Both also are looking to the Imperial Legislature to help them, and though they cry loudly, the political gods are silent. If by legislative acts relief is given in one way, some burden is laid on in another, and there is therefore little or no actual redress of grievance. Both are found asking for some new fiscal arrangements by which a check can be placed upon foreign imports, so that enhanced prices may fall to the lot of the home producer; but that is a matter upon which the multitude, who are the consumers, and who will have cheap prices, must have something to say.

The traditional policy in former times of the party now in power favoured restrictive tariff duties on foreign imports; but the responsible leaders of that party at the present time abjure anything in the way of Protection. The bewildered producer has no more chance of help of that character from politicians than of changing the courses of the stars.

The market gardener feels the pressure of another drawback. The growth of communities round the centre—London—involves the absorption of land for house building that has hitherto produced market-garden produce; and he is being driven farther and farther from the centre to the circumference, but as he travels further afield he does not by any means find land cheaper, wages lower, or local rates lessened, while he has to submit to a greater cost in the way of wear and tear

in having to send his productions an increased distance to market, and is placed at a similar disadvantage in carting back his manure, &c. Take the county of Middlesex, for instance—the centre for many years past of some of the most important market-gardening operations of the day. The absorption for building purposes of land formerly devoted to vegetable products, goes on at an astonishing rate, and the market gardener is driven farther and farther afield. He has to seek other openings for his particular industry; and as soon as agricultural land is utilised for the production of fruit and vegetables, its value goes up rapidly. If in going farther away from the centre the market gardener expects to be helped by a lower rental, he invariably finds himself mistaken. In Middlesex, especially, the supply of land diminishes while the demand increases. It is impossible to increase in extent a superficial acre of land. All that can be done is to make it increasingly productive, and bear crops of the highest value that will command the best price in the market. Great centres of population must be fed; therein lies one gleam of hope; and the market gardener near London may perhaps console himself with the reflection that at a not distant day the growth of population will restrict the areas of cultivation, and a falling off in the supply will mean an advance in prices.

The market-gardener has not only to contend against certain economic principles which affect the tenure of land, increased cost of production, the advance or decline in prices, &c., but he has also to battle with natural forces difficult to grapple with, and which he is powerless to control. Drought, severe frost, withering winds, late and inclement seasons—all these occur, and not at infrequent intervals. How many market gardeners saw in November last a promise of abundant green crops, that literally died away to almost nothing under the influence of prolonged nipping winds, followed by a retarding spring which kept all vegetable crops at a standstill almost until the second week in April. These are opposing forces that have to be considered in the struggle to make market gardening pay.

The market-gardener is sometimes advised to take to fruit-growing in the certain assurance that it will pay. Such advice must be taken cautiously; much depends upon the locality, and more upon the nature of the soil; and it is above all things necessary to grow only such fruit as is likely to command remunerative prices, and to send it to market in proper condition at the proper time. The times have changed for the market-gardener as well as for the farmer. He needs to be a man of pluck, perseverance, and energy, diligent in business, industrious, undaunted, with large powers of foresight and keen calculation. He must not only grow suitable crops, but grow them well and market them judiciously, and if he can, better than any neighbouring competitor. He should know something of the adaptability of crops to soils, and calculate to a nicety when to sow and when to gather. It is by means of enterprise, fertility of resource, and unwearied attention to his business that he can hope to win in the race, and, having these qualities, let us hope that Nature may compassionate his endeavours, and gladden his heart by bringing forth the kindly fruits of the earth in due season.

ROYAL HORTICULTURAL SOCIETY.—From Jamaica and from Victoria we receive congratulatory letters as to the improved prospects of the Society since its departure from South Kensington. Some

Australian friends show their sympathy by becoming Fellows. Let us hope that ere long we may see flourishing branches of the Society in each of the Colonies.

THE TEMPLE SHOW, of which we published a full report last week, affords one more illustration of the general rule that big shows do not pay—at least directly. Successful as it was in some respects, it was not so financially—a circumstance that will not excite surprise when the unfavourable character of the weather is remembered. As a show it was magnificent and full of interest, and hence it must have been a cheap advertisement, and will have induced many to have become subscribers. From this point of view it is significant to add that over eighty new Fellows were elected on Tuesday last. Although we take it that the Society is bound to give something to its subscribers, and bound to keep itself prominently before the public, yet the holding of large shows is a very secondary part of its legitimate work, as the benefit to art and science conferred by these great exhibitions is by no means commensurate with their cost, the smaller fortnightly meetings being relatively far more useful and interesting. The difficulty seems to be to get the public to realise that fact. Meantime, the finances are steadily improving, and the muster-roll of Fellows largely increasing.

LINNEAN SOCIETY.—The centenary anniversary of this important Society is in course of celebration as these pages are passing through the press. We have already published the programme of proceedings, and in our next we hope to give particulars of this interesting event, the opening of which takes place at such an hour as to preclude further notice this week.

GARDENERS' ORPHAN FUND.—Another local secretary has organised an entertainment in his district on behalf of the Fund. Mr. J. SMITH, Mentmore, announced a concert for Tuesday last, which we are pleased to learn was a complete success, and resulted in a satisfactory balance for the Fund.

THE ROYAL NATIONAL TULIP SOCIETY.—The annual exhibition of this Society will take place in the gardens of the Manchester Botanical Society, on Saturday, June 9. It may be stated that the opinion of all the growers who exhibit at the annual show is taken as to the best date on which to hold it: and that most generally approved is then selected. On the whole Tulips promise to be late, but very much depends upon the character of the weather. A few days of the high temperature experienced in Lancashire on the 19th inst. would bring on the flowers with remarkable rapidity.

NATIONAL CHRYSANTHEMUM SOCIETY.—A deputation from the committee of this flourishing Society visited Sheffield on Saturday last with a view of arranging the preliminaries of the provincial exhibition to take place in that town in November next. The deputation consisted of Mr. R. Ballantine (Vice-President), W. Holmes (Hon. Secretary), and Messrs. G. Stevens, L. Castle, and G. S. Addison, who were cordially received.

A MANUAL OF ORCHIDACEOUS PLANTS.—MESSRS. JAMES VEITCH & SONS send us part iii. of their excellent work under this title. It contains the Dendrobates, and with its maps and figures is far too important to be dismissed with an *accusé de réception*. We must notice it at greater length when we have had an opportunity of more thoroughly examining its contents. Meanwhile we shall be doing orchidists a service by telling them to buy it.

COVENT GARDEN MARKET AUCTIONEERS' AND SALESMEN'S ASSOCIATION.—The inaugural dinner of the members of this Association was given on Thursday, at the Hammums Hotel, Covent Garden, when Mr. W. N. WHITE occupied the chair. The design of the Association is to promote and

protect the general welfare and interests of those auctioneers and salesmen who are connected with Covent Garden Market; to maintain uniformity in the rules of the trade, in so far as they affect the auctioneers and salesmen in the market; and to establish just and equitable principles. It will also be the endeavour of the Association to co-operate with auctioneers and salesmen in dealing with other parties in other markets, to minimise risks in relation to any business with each other. Members will be provided with the use of a telephone. After dinner, in submitting the toast of the evening,

direction, and he had no hesitation in saying it would meet with the success it deserved.

CHAMBRE SYNDICALE OF GHENT.—At a meeting held on Monday, 14th inst., the following distinctions were awarded:—

First-class Certificates.—To *Cattleya Lawrenceana*, *Cypripedium Sanderianum*, and *Odontoglossum Pescatorea alba*, from Messrs. Vervaeet & Co.; to *Cypripedium Godefroyæ*, from Mr. J. Hye-Leyden; to *Odontoglossum crispum* var., from Mr. J. Bray; to *Dichorisandra taniensis*, from Mr. Ed. Pynaert.

since the Jubilee in planting the trees, which will be so arranged as to represent the words, "Jubilee, 1887." Each letter measures 200 yards in length, and 25 feet in width. The first tree of the letter "J" was planted on Jubilee Day.

TREATISE ON THE CULTIVATION OF THE PANSY (ALEX. LESTER).—This is a practical pamphlet by an enthusiastic cultivator of the flower: conveying all that it is necessary for a grower of the flower to know, whether for exhibition or ordinary purposes in the flower garden.

FIG. 87.—SENECIO CRUENTA: THE ORIGINAL CINERARIA, TOGETHER WITH ILLUSTRATIONS OF ITS MODERN DEVELOPMENTS. (SEE P. 654.)

"Success to the Association," Mr. DENNIS observed that it had only been in existence for about two months, but in spite of that it had grown very considerably. The interest of the salesmen and auctioneers in the market, as well as that of the British public, was primarily the purpose for which the Association was formed. They had recognised two things—that unity was strength, and organisation meant order, efficiency, and economy, and they had endeavoured to organise that which previously had no shape or form. The Association would be able to make regulations for the proper conduct of the business of the market. The tariff charges, too, would be closely looked after. The Association had done some good already in that

REGULAR PELORIA.—Mr. MEASTRES sends us a bloom of *Cattleya intermedia* in which the two lateral petals have the form and coloration of the lip, so that practically there are three lips. The column is erect, flattened, with a terminal anther, and with two wing-like processes at the side. Similar variations have been figured in the *Gardeners' Chronicle* from time to time.

JUBILEE PLANTING.—Mr. ASSHETON SMITH, says the *Agricultural Gazette*, is commemorating HER MAJESTY'S Jubilee in a remarkable manner. He has caused to be planted on the slopes of Moel Rhiwen mountain a plantation composed of 630,000 trees. Nearly 200 men have been constantly employed

M. DE LA DEVANSAYE.—This enthusiastic cultivator of Anthuriums recently obtained at the Versailles Horticultural Exhibition the *grand prix d'honneur*—a Gold Medal—offered by Baron DE ROTHSCHILD, for his collection of these plants.

THE DESTRUCTION OF THE SHOOTS OF FIR TREES.—Miss WYNN, Appleby Hall, Doncaster, writes:—"The cause of similar mischief to that noticed by your correspondents in your paper for May 5 was due to the stubbing up of the Hazel bushes which had formed the undergrowth in the woods at my home, to replace them with other subjects. The squirrels were, by this act, deprived of their customary winter store of nuts and were

driven by hunger to attack the Firs and Chestnuts, which had not happened before. If gentlemen with estates would plant a piece of ground with Nut trees it would prevent the necessity, or the wish, to destroy the most beautiful of all wild animals in this country." We are sorry not to be able to concur.

STATE SCHOOL OF HORTICULTURE AT GHENT.—M. Eo. RODIGAS has been appointed Director of this establishment, in place of the late Professor KICKX. M. RODIGAS, in consequence, retires from the direction of the Zoological Garden, which he has done so much to improve, but has been appointed Honorary Director of that establishment.

SUN POWER.—Mr. PREECE, in a recent lecture before the Royal Institution of Great Britain, stated that on a fine summer's day the sun expends an average of 1 horse-power on every 30 square feet of the earth's surface in this latitude, or 1450 horse-power per acre. This great gift of energy is neither utilised nor stored by man at present, though Nature presents us with some of it in waterfalls and flowing streams. The sun itself has been more generous. Ages upon ages ago it shone with resplendent glory on a grand luxuriant flora of a uniform but flowerless character in a climate warm and damp. England formed part of a tropical jungle or swamp, where grasses, mosses, ferns, and sedges, Coniferae, Arancarieae, Equisetaceae, Sigillariae grew and flourished, perished and fell *in situ*, to be covered up by the following geological formations and compressed into those grand seams of coal that form now the principal source of England's greatness and wealth.

THE BRITANNIA FRUIT PRESERVING COMPANY.—This company has been formed for acquiring and developing the business of fruit growing and fruit preserving carried on by Mr. A. C. WILKIN, at Tiptree Heath, Essex, who will become Managing Director. The amount of the shares is fixed at £50 each. The Secretary is Mr. W. H. SNOTER, of Colchester, and the offices are at Trewlands, Tiptree Kelvedon, Essex.

ABIES (OR PICEA) AMABILIS.—Mr. RASHLEIGH obligingly sends us male catkins of this species, which are of value, first, because, so far as we know, they have not been figured; and next, because they are so different in colour from anything known to us. They are solitary, linear-oblong, one-third shorter than the axillary leaves, and of a greenish-yellow colour. The anther crest is retuse and emarginate.

PATCHOULY.—In connection with the subject of Patchouly, referred to at p. 616 of the *Gardeners' Chronicle*, November 19, 1887, vol. ii., 3rd series, and also in the March number of the *Kew Bulletin*, our contemporary, the *Chemist and Druggist*, gives some further information, from which we cull the following facts. The supply of the dried herb, it seems, as well as of the oil itself, has lately been very uncertain and insufficient, probably because the steamers plying between Europe and the Indian ports from which the article is mostly shipped (*viz.*, Penang and Singapore), refuse to accept consignments of Patchouly on account of the danger to other goods stored in its vicinity from the powerful odour imparted by the oil. It is scarcely possible that such communication could take place to any inconvenient extent if the Patchouly were packed with sufficient care, and if the goods placed in the immediate neighbourhood of the shipment were selected with some discrimination; but the fact remains that for a considerable time there has been a great scarcity, and that a market could be found in Europe for considerable quantities of fine leaves and pure oil, as Patchouly, though perhaps its popularity as a perfume is slightly on the wane, is still used largely in conjunction with other essential oils, notably otto of Roses, while the dried leaves are well liked as a sachet powder. London is the central market of the Patchouly trade, and our contemporary says that

the demand is such, that if shipments of good picked leaves could be quickly made to London, the shippers would be able to pocket a very good profit, as the distillers in Germany and southern France, as well as the American consumers draw their requirements from us. "It is not improbable that we shall soon receive supplies of Patchouly leaves and oil from other than the accustomed quarters. In 1886 only 5280 oz. of oil and some 18 cwt. of leaves were exported from Penang, whereas a few years previously the imports of leaves alone in London reached between 600 and 800 cwt. per annum. In 1886 a large German firm, with the idea of emancipating our market from its dependency upon the East, forwarded a supply of seed to Paraguay, in South America, and although the head of the Straits Settlements Forest Department reports 'that plants raised from seed are said to have no scent, but they retain it when produced from cuttings,' the German house seem confident that their efforts will be successful. Patchouly growing is also being tried in the Island of Dominica, and we hear that experiments are said to have been set on foot in Guadalupe, Martinique, and other French West Indian possessions. Some years ago supplies of Patchouly leaves of very good appearance, though somewhat deficient in aroma, used to be imported into Europe from Java, but this source appears to have dried up lately."

RUGBY AND DISTRICT CHRYSANTHEMUM SOCIETY.—The annual exhibition of this Society will take place on November 21 and 22. Prizes for fruit and other subjects are also offered.

MELONS IN AFGHANISTAN.—The following remarks are taken from Dr. J. E. S. ARCEMSON'S paper on "The Botany of the Afghan Delimitation Commission," in the *Trans. Linn. Soc.* for April:—

"Creeping amongst them, and in great luxuriance, was the wild state of Cucumis Melo, covered with fruit, none averaging over 1½ inch in length. Whilst young the fruit is pubescent, on ripening perfectly glabrous. These were eaten with avidity, both raw and cooked, by the camp followers. I must say that the ripe fruit has a most delicious aroma sufficiently tempting to induce any one to eat it. . . . I should say that Water Melons rank next to Wheat in value as a food crop. During two or three months of the hot weather the natives seem to live entirely upon them, with a little bread; and they contain so much saccharine matter that in Herat a syrup, or sugar, is extracted from them. Ordinary Melons are cultivated, but in much less quantity than the Water Melon, and mixed with them is a great variety of Pumpkins and other Cucurbitaceae. In these Melon fields it is curious to see, either sprinkled thinly through them, or growing in single lines along the outer margin of the fields, the Castor-oil plant, cultivated as it was in GAIFFER'S time, for its oil for burning, the inhabitants being still ignorant of its uses as a medicine."

TREE PÆONIES.—Those gorgeous flowers of spring are now at their best in southern gardens. Mr. T. S. WARE forwarded to us a show-box full of very large sized blooms, the best of which were Reine Elizabeth, nice shade of pink; Aissina, white with crimson centre; Donklaari, flesh colour, very full; Rinzi, rosy-purple; Colonel Markham, purple; and Blanche de Noisette, white, with some tinge of purple at the base of the petals. Some German Wall-flowers, with short compact spikes of double flowers, come from Mr. CANNELL'S gardens at Swanley. Some of the colours are bright and decided, others are dingy, but yet might be made effective in the mass, whilst all are sweet-scented.

SMUT (USTILAGO SEGETUM) IN OATS AND BARLEY.—Mr. J. L. JENSEN, Copenhagen, writes:—In my communication on this subject (p. 556) I stated:—"It is very possible that if the Barley had been moistened for twenty-four hours, and then subjected to a temperature of 45° C. for five minutes, the desired result would have been obtained." It should have been 56° C.

DISEASE OF ORNITHOGALUM.

SOME time since a correspondent of the *Gardeners' Chronicle* forwarded examples of Ornithogalum nutans badly affected by the fungus named Heterosporium Ornithogali (see *Gardeners' Chronicle* for June 25 last, p. 840, for figure). He wrote:—"Large clumps are attacked, and in a very few days the whole mass of foliage falls down a blackened mass, as though it had been burned, and it spreads from clump to clump with amazing rapidity." The examples which reached us were jet black in colour from the profuse growth of the fungus, which entirely covered the foliage; the colour came off as clammy dust upon the hands; the fungus was growing with great activity, myriads of spores being in the act of germination.

The fungus is one of the brown moulds, and judging by its specific name would appear to be confined to the genus Ornithogalum. The upper portions of two leaves are shown in the accompanying illustration (fig. 88), and the fungus-threads and spores are enlarged 400 diameters in the left-hand bottom corner. The spores, as seen under the microscope are very handsome pale brown bodies, finely spinulose, and either unjointed or divided into from two to eight parts. The spores readily drop from their supports, they are then carried by the air on to other Ornithogalum plants, where they immediately reproduce the disease and demolish all parts of the plant above ground.

Heterosporium is one of the so-called brown moulds—Dermatitiei. The plant before us is closely allied to the fungus which produces cracks in Apples and Pears—Cladosporium dendriticum—described and illustrated in the *Gardeners' Chronicle* for November 28, 1885.

I have only once before heard of Heterosporium attacking Ornithogalum, and that was from Mr. William Phillips, of Shrewsbury. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

RHODODENDRON FALCONERI.—It may interest your readers to know that this scarce species is now in full flower at Sir Kenneth Mackenzie's seat, Gairloch, Ross-shire. Sir Kenneth, writing about it, says, "It has been planted out here for, I think, twenty-five to thirty years, and is about 11 feet high, and as much through; it is now flowering for the first time. There was once before a single bloom on it, but this year there about 150 now expanding. The plant is not common. It is one of which the seed was brought by Sir Joseph Hooker from Sikkim. I am not sure if there has ever been a second distribution of this species, or whether it was ever in the hands of the trade. I never see it in catalogues, and the specimen here was obtained by me from the Botanic Gardens, Edinburgh about 1860, as far as I can recollect." *Howden & Co., Inverness.*

HERBACEOUS PÆONIES.—There cannot be the least doubt that a position where the plants can enjoy full sunshine is the right place for the well-doing of these showy plants, and not only do they then thrive well, but show off their beauty most advantageously. We have here growing in the borders on each side of the drive (which is a straight one) rows of Pæony plants, 440 yards in length, the clumps of which stand at 12 feet apart, and are in some instances, 4—5 feet in diameter. Between the drive and the border is a margin of turf 27 feet in width; and when the plants are in bloom displaying shades of colour varying from deep crimson to almost pure white, and some sweetly scented, the sight is very interesting. To assist the plants during their growing season we give them a good mulching with rotten dung, and occasionally drench them with the farmyard drainage-water. *H. Markham, Mereworth Castle.*

HYBRID DAFFODILS.—I enclose a few flowers of hybrid Daffodil, *N. Pseudo-Narcissus* × *N. poeticus* (*N. Bernardi* of De Candolle). The bulbs were collected by me in the Pyrenees when in flower in June, 1886. They are the natural prototypes of the

"Leeds" hybrids, which are now so well known. I think Mr. Barr will agree that not many Daffodils, even with the longest names ever given at Tooting, can compete for beauty with these unnamed children of Nature, endless in variety of form and tint of colour. I also send three scapes, each with three flowers, of another natural hybrid, *N. muticus* (Gay) × *N. juncifolius* (Lagasca). This hybrid is a comparatively recent discovery. It is common near Gavarnie. In Nature the scapes are nearly always one-flowered, but in my garden they are mostly three-flowered. *C. Wolley Dod, Edge Hall, Malpas.* [The specimens sent some time since by Mr. Wolley Dod, but of which we were obliged to defer notice, were of extraordinary diversity and beauty. The largest flower measured 4 inches across, with broad creamy-white segments and a cylindrical deep yellow cup more than half the length of the segments. The smallest flower measured 2 inches across. In the form of the cup there are numerous gradations between a short cup and a long trumpet, and almost every shade of colour between pale primrose and deep orange. One had two flowers within one spathe. The other hybrid mentioned has tufted yellow flowers, deliciously fragrant. Ed.]

THE EDUCATION OF YOUNG GARDENERS.—It is almost astounding when we take into consideration the progressiveness of the period, and the degree to which every branch of industry is benefited by the application of science, to find the "old practitioners," if I may so term them, more or less horrified at the idea of their young men enquiring into the why and wherefore of their work. The notion uppermost in their minds appears to be that because they formerly did such a thing at such a place, and at such a time, they must of a necessity do the same again, not always perhaps taking into consideration change of circumstances. The studying of the transition between the "cause and the effect" to those persons seems utterly useless. There is also, I believe, a frequent complaint amongst head gardeners of the want of direct interest as shown by young men in their work. There again they do not appear to take into consideration the greater counter-attractions for young men of the present time that were non-existent say, thirty or forty years ago. These counter-attractions need not be discussed, as they are obvious. The best antidote that I have found to these is the study of botany, which I would recommend to my fellow journeymen. Botany is well calculated to draw out the powers of observation, and a gardener who is interested in the study of botany is, I maintain, also interested in his daily occupation. In conclusion, as one who is "struggling for existence," I thank the *Gardeners' Chronicle* for its action in this matter, and urge on all those who have the success of their profession at heart to continue the agitation for a higher—in the sense of a more appropriate—education of young gardeners. *A. Hartless.*

ACER SCHWEDLERI is just now very beautiful. The young leaves are of the rich colour of a Copper Beech, forming a lovely contrast with the pale yellowish-green flowers. Either, as an ornamental tree, or to mix in with the tender colouring of spring flowers in bouquets for the table, its leaves and flowers cannot be too highly estimated. *E. M.*

HELLEBORUS FŒTIDUS.—In walking through a plantation the other day I came quite unexpectedly on a fine group of the above (popularly known as Bear's-foot), and was compelled to admire its attractiveness and its suitability as a plant for growing in woods and even in parts of the garden where a shady position could be found for it. The flower-stems are 12–13 inches high, and are surmounted by large panicles of pale green flowers tinged with purple. A well drained chalk soil suits it best. *J. H.* [It grows in heavy loam where there is no chalk just as well. Ed.]

SINGLE DAFFODILS BECOMING DOUBLE.—The way that I account for this supposed fact is, that in consequence of the great rage for Daffodils about five or six years since isolated lots of wild English "pseudos," which had flowered on lawns, &c., undisturbed for years, were probably collected into better quarters for the purpose of producing better flowers. Among the starved clumps or masses, probably planted for many years, were *Telamonius plenus*, which naturally from starvation would run partly single. This occurring often near the roots of trees or on light soil, or again even in rich soil where the mass had got too dense, and also that

the sun's heat—needed to develop all double flowers properly—never reached the centre bulbs, caused the outer ones only to bloom. Some such clumps were put into cultivation, and what more natural than that the doubles showed again? I agree with Mr. Dod, as I have myself been trying experiments with single Daffodils, and I never yet got one to become double. I have found that the "double" English pseudo (true) in a starved state became almost single, very dwarf, and stunted; but when put into garden soil, developed into a form not unlike *Telamonius plenus*; but when I planted the bulbs again in the grass they reverted to the original form—and probably in the course of years may go partly single, with the shadow of a double flower within them to puzzle some future Daffodil fancier. *W. B. Harland.*

A THREE-FLOWERED NARCISSUS POETARUM.—We herewith send you a few blooms of *Narcissus poetarum*, one spike having three flowers, which we consider unusual. The large bloom sent has come amongst the specimens of *poetarum*, but you will see it is paler in the eye, much larger, is a stronger grower, and flowers earlier. *Pope & Sons.*

FIG. 88.—HETERO-SPORUM ORNITHOGALLI (DISEASE OF BULBS OF ORNITHOGALUM). (SEE PAGE 658.)

IRIS SUSIANA.—It may interest some of your readers—who, like myself, may have longed in vain for *Iris susiana* to flower in their garden—to know that we had at this moment seven healthy young plants in bud—one bud each. Should there be reasonable warmth and sun-shine, another week will see them all in bloom. My gardener has, after long trial, discovered how to treat this most weird and wonderful and difficult of Irises. Last summer we had but one bloom out of several plants; this year all the plants will bloom except two or three. *E. J. B.*

A FIELD OF FLOWERS.—The above title, originated I believe by Dean Hole, well describes the prettiest floral display to be seen in this neighbourhood last season. Mr. Bellis, the gardener at Newstead Abbey, having a large piece of ground (about half an acre), which he was for some time unable to crop, was induced by our manager to purchase a mixture of 6 lb. of flower seeds left over from the preceding year, which would ordinarily have been thrown away, and to sow the ground with it. This was done; and the seed, which included a portion of

almost everything in our catalogue, was well mixed and sown broadcast. The result was a display combining the most gorgeous effect of colour produced by the bedding system with the attractive negligence of the wild garden, and which was much admired by every one who saw it. Those who have old or surplus seeds in stock would do well to take the hint, and utilise them by sowing thickly any waste spot or wild part of the garden. *Charles E. Pearson, Chilwell.*

PRIMROSES IN RURAL DISTRICTS.—In the Notes and Queries column of *The Echo* there recently appeared an enquiry, as to where common Primroses could be met with near London? A sensible reply is given under the name of "Selborne," who gives the name of a locality in Kent where Primroses can be found in abundance, and he wisely adds, "Visitors are requested not to carry away roots." Some such caution as this is necessary, for, mainly owing to the institution of the Primrose League, Primrose plants have been taken up by the thousand, in order to meet the requirements of political celebrations. Hundreds of these plants find their way into suburban gardens, only to die ere the summer is over. The immense quantities of blossoms that are gathered in April tends to rob the country of thousands of what would be naturally sown seedlings; and the demand for seeds of the common Primrose is becoming larger every year, and it is rising in price. It is too much to say that there is danger of the Primrose being lost, but it is necessary to enter a protest against the destruction of plants which goes on annually in such a needless manner. *R. D.* [We think the danger is overestimated. Ed.]

DOUBLE CINERARIAS.—Beautiful and useful as are the flowers of the double varieties, and durable, too, in comparison with the somewhat fleeting character of the single varieties, they have yet, so far, failed to become popular. During the past fifteen years they have been produced from time to time, to be hailed with interest and admiration, and then become eclipsed by other novelties. Why this should be so, it is difficult to say, for the double Cinerarias possess qualities that seem to fit them for general culture; but they have certainly failed to hit the popular taste so far. But the fine varieties which Messrs. Henry Cannell & Sons, of the Swanley Nurseries and Messrs. Kelway & Son, nurserymen, of Langport, have raised, may be the means of exciting a new interest in these double Cinerarias. At Swanley double Cinerarias in bloom can be counted by the hundred, Mr. Cannell having procured some of the best of the older varieties, and obtained some seed from them; the result is that he has raised a large number of seedlings, not a few being of high merit. His main difficulty lay in selecting the very best for naming, for if these double Cinerarias do become popular, those who fancy them will desire to have plants of the fine varieties certified by the Royal Horticultural and Royal Botanic Societies; for seeds cannot be depended upon to reproduce the exact varieties, though they will do so to a considerable extent. Mr. Cannell took a batch of his new varieties across to the recent International Horticultural Exhibition held in Ghent, where they appear to have been warmly appreciated. The new varieties Mr. Cannell has selected for naming are as follows:—Blue shades: Indigo Blue, the deepest blue of all—rich indigo-blue, slightly tipped with lake, large and very double flowers, and extra fine quality; *Aspasia*, deep blue—large, full, and symmetrical flower, dwarf habit, and compact head of bloom (awarded two First-class Certificates of Merit); *Advance*, violet-blue, large, full, and very fine, dwarf bushy habit—considered to be a decided advance upon Mr. Thomas Lloyd (awarded a First-class Certificate of Merit); *Beauty*, of a pleasing shade of lavender-blue, large globular flowers; and *Mauve Queen*, mauve, tinted with violet, the base of the florets slightly white—quite distinct. Crimson, rose, and pink shades: *Crimson King*, deep crimson, slightly shaded with magenta—medium-sized flowers, excellent form; *Superb*, bright magenta—dwarf habit, and remarkably free; *Perfection*, rosy-magenta, of a very pleasing shade—dwarf and bushy, extra fine; *Faust*, clear bright rose, slightly white at the base of the florets—flowers large, and freely produced in compact trusses (awarded two First-class Certificates of Merit); *Mary Anderson*, clear magenta, the base of the florets pure white—very double and distinct; and *Gem*, very bright blue-pink, dense heads of flower—dwarf and compact habit. Tipped varieties: *Rosalind*, pure white, deeply tipped with blue, large flowers, compact

heads, highly effective; Clare, white, edged with deep mauve, and occasionally shaded with rose; Gigantea, violet-blue tipped with lake, the reverse of the florets white—immense well shaped flowers; Miss Cannell, pure white heavily tipped with clear magenta, shading off to a lighter tint towards the base of the florets, fine and distinct; Nellie, white, edged with deep clear pink, well formed flowers, very attractive; Marguerite, pure white, tipped with lilac, very pretty; and Mr. Midson, white, broadly tipped with a pretty and delicate shade of lilac, large full flowers, quite distinct. After the plants have been cut down to within 4 or 6 inches of the ground, they are then stood in a cold frame, or on the cool and shady side of a hedge; and as soon as the young growths are sufficiently advanced, they are taken off and inserted as cuttings in the ordinary way. That the double varieties are a little more difficult to cultivate than the single ones is true; they do not make so much root as the single forms, and therefore should not be overpotted. The blue-flowered varieties are found to put forth more roots than the others. They are found to grow freely in good Cineraria soil, and the pots should be well drained. R. D.

FRUIT PROSPECTS.—The prospects of the fruit crop in the north of Yorkshire are in many respects good; Apricots are setting well, and will be plentiful, if we have no spring frosts to destroy them. The Plum crop looks badly, although odd trees appear to have plenty of bloom-buds. Many trees that bore a good crop last year are now almost without a bloom-bud. Pears are fairly good in this neighbourhood, especially on trees that bore a light crop last year. The best appearance is made generally on trees grafted on the Quince stock, which promise to carry a good crop two years in succession. Trees several times grafted on the Pear stock also show for a good crop. Apples promise to be good on many trees, especially those that bore light crops last year. Some that carried a crop last year are now without a bloom-bud. In a garden where there is a variety of trees the crop no doubt will be sufficient. Trees grafted on the Paradise stock are decidedly the best; the fruit-buds are not so fine as I have seen them, owing, no doubt, to the drought of last summer, and to the many cold nights which followed hot days. On several occasions the thermometer fell from 75° in the day to 35° at night, so that neither Apples nor Pears were of their usual good quality in this part of Yorkshire. Bush fruits suffered terribly from the ravages of bullfinches. Gooseberry bushes in some instances were quite spoiled. Nuts promise to be good, if they are not destroyed by spring frost. *William Calverwell, Bedale.*

POLEMONIUM CONFERTUM.—Amongst many plants which seem to have derived new life from the hot suns of last summer, I may mention *Polemonium confertum*. Until now it has scarcely maintained a miserable existence; it is now a compact leafy tuft in perfect health, with seven flower-spikes, of which I enclose a specimen. It is the best I have yet seen of the *Polemoniums*. It seems to require a very strong and open soil, and moderate shelter. Mr. Wood, of Kirkstall, gave me the plant, and advised me how to treat it. *C. Wolley Dod, Edge Hill, Malpas.*

GESNERA CARDINALIS.—This is one of the best *Gesneras* to grow. For the last five or six weeks a group of plants of this species has been flowering incessantly in the Begonia-house at Kew, where they have attracted much attention. Each plant grows to the height of 12 or 18 inches, and is of compact habit. The stems, arising from the large tubers, are thick and fleshy, giving off opposite cordate-crenate and somewhat crinkled leaves, which are more or less horizontally placed on the stem. The lower leaves measure generally about 8 inches long, and are wide in proportion. The leaves become smaller as they ascend, often ending in mere bracts. The flowers, which are produced in clusters from the axils of the upper leaves, are about 3 inches in length, with a rather long bilobed upper segment; the lower segment is divided into three lobes, the middle one having a few very dark blotches on the inner side. The colour on the outside is a bright scarlet, but is much fainter inside the tube of the flower. The entire surface of the plant is densely clothed with short soft white hairs. The cultivation of this species is a comparatively easy matter. The batch of plants in question were nearly all raised from seeds sent to Kew about March of last year. The seeds soon germinated, and when the seed-

lings had formed a couple of good leaves, the best of them were pricked into pans, and allowed to remain in them until the beginning of the present year, when again the strongest plants were potted into 5-inch pots, in which they are now flowering. The best soil to use is light loam and peat, with some leaf-mould and sand, all well mixed together, while the temperature should be moist and tolerably warm, to keep them in good flowering condition. *J. W. Q.*

VINE LEAVES TURNING YELLOW.—Will you, or some of the readers of your paper, kindly explain why the leaves on one particular spur of a Vine which I have in one of my early houses should from infancy to maturity remain cream-coloured, all other growths on the same rod remaining of their natural colour? The rod is planted in an outside border, which is well drained, and has always carried a good crop of fruit, the particular spur always finishing its fruit equally well with the others. This has now been a regular thing for many years past, the spur always breaking well, and every growth on it being of the same abnormal colour. I enclose a leaf for your inspection, and trust that some light may be thrown upon the subject. *W. R.* [It is a case of "sporting," but it is impossible to give a satisfactory reason for it in this case. A Horse Chestnut in our neighbourhood does the same thing annually. Ed.]

HABROTHAMNUS ELEGANS.—What a fine old thing this is when planted out in the conservatory or greenhouse, where it can have room for both roots and top, for, when so favoured, it seldom, if ever, ceases blooming, for as the growth is continuous and the flowers form at the ends of all the young shoots, from which they depend in long racemes, plants are more or less gay all the year round. If wanted in full beauty at any particular season, the way to manage it is to keep the plant dry for two or three weeks or so to rest it, and then prune back, after which it will quickly break, when a soaking of liquid manure or water should be given, and the breastwood allowed to grow out at will. The most suitable places to grow this *Habrothamnus* are on back walls, or on pillars, or other roof supports, where it can have plenty of light and sun, in which position it shows itself off to the greatest advantage. In preparing the border it should be made deep, and have good drainage; the soil best adapted to grow the plant in is fresh turfy loam, with just sufficient sand to keep it open and porous. *J. S.*

COUNTY GOVERNMENT BILL.—I am glad to notice that you urge the Council of the Royal Horticultural Society to call a public meeting of market gardeners and others engaged in horticulture to discuss the Local Government Bill, and the proposed new Department for Agriculture. It is rumoured that the cost of administration of the new county government will be very expensive. The annual outlay is variously estimated at from £5,000,000 to £10,000,000. If the lowest estimate is taken, and deducting the amount of £3,000,000 which is proposed to be transferred from the Imperial Exchequer there will still be a deficiency of about £2,000,000 to provide for by an increase of taxation, and assuming £150,000,000 to be the present rateable value of England and Wales, this would mean an increase of taxation of something like 2d. in the pound. Land already has to bear very heavy charges for local purposes in the shape of poor-rates, school board, police, and highway rates, &c. In some districts of Surrey I have known corn, Cabbage, and grass land to have to pay a sanitary rate of 6d. in the pound; and farm land in some parishes has to pay for the lighting of the village. What will be the effect of taking towns out of this Act and constituting them counties of themselves? Towns have a higher rateable value than districts of equal area. Country members should investigate this point, otherwise country districts may be called upon to bear an undue proportion of the county expenditure. For instance, the county of Surrey contributes something like £3000 a year towards the maintenance of the London bridges. If a large slice of metropolitan Surrey and the borough of Croydon be taken out of the county and formed into counties of themselves, unless the amount paid by the county for the repair of the London bridges is proportionately reduced, the agricultural land in the county will have to contribute an undue proportion. I hear on good authority that the County Council of Surrey will have fifty-two elective, and seventeen

selected members; twenty-six of these will be elected by urban, and twenty-six by rural districts, and they will be elected *en masse*; the County Council thus formed will proceed to cut up the country into districts for the purpose of the creation of the district councils, who are to replace the present Local Boards and Rural Sanitary Authorities. These new authorities are to take over the liabilities of the old bodies. It seems unfair that the new districts should be called upon to take over liabilities incurred by authorities and districts with which they previously had no connection; land which now is comparatively lightly rated will have to bear burdens which they never incurred or sanctioned and from which they have enjoyed no benefit. Agriculturists should make themselves acquainted with the provisions of this Act, and should urge their members to watch the Act, otherwise they will find themselves worse off than at present. *Rusticus.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, MAY 22.—Owing to the Whitsun holidays last Tuesday's meeting was a comparatively bare one, and only a few visitors attended.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. J. Fraser, J. Walker, H. Herbst, W. Goldring, W. H. Lowe, G. Paul, R. Dean, E. Wynne, H. Ballantine, J. Dornay, H. M. Pollett, J. O'Brien, E. Hill, A. J. Lendy, W. Holmes, G. Duffield, and J. Laing.

A few very interesting Orchids were shown, one of the most noticeable being *Cypripedium bellatulum*, from Messrs. H. Low & Co., Clapton, a new discovery which Prof. Reichenbach has classed as a species (see p. 648). The flower is exactly like a very vigorous *C. Godefroyae*, but is more heavily spotted, and a dried flower measures 4 inches in diameter. The plant shown bore two expanded flowers, which were not fully developed, and which had been found partially open on importation, and consequently were not properly coloured. We shall shortly give an illustration of this flower.

Mr. Glover, gar. to E. Ellis, Esq., Manor House, Wallington, Surrey, showed a few good plants, which were *Cattleya Schroderae* (fine), *Mormodes buccinata flavida*, Indian-yellow, with the labellum and column slightly paler, *Thunia Marshalliana*, *Angraecum Sanderianum*, *Oncidium Marshallianum*, and *Cattleya Lawrenceana*, all of which were good well-grown specimens.

Cattleya Mossiae, a good full-coloured form, was sent by Mr. Gordon, Twickenham; and Mr. Cowley, gar. to F. G. Tautz, Esq., Studley House, Shepherd's Bush, had a pure white form of the same species called *Studleyana*, the lip was tinted with crimson; he also had a good plant of *Cattleya Wagneri*, another white species.

Cattleya Mendelii alba, pure white, with a pale tint of yellow at the base of the throat, was shown by Mr. Kidd, gr. to R. B. White, Esq., Ardaraeh, and he also had a form of *C. Mossiae* named *superba*, which was well coloured. Mr. Ballantyne, gr. to Baron Schroder, The Dell, Egham, sent a spike of *Acerides Fieldingi alba*, pure white throughout, and very beautiful.

A very interesting plant was shown by Messrs. J. Veitch & Sons, Chelsea, S.W.; it was a hybrid *Epidendrum*, between *E. radicans* and *E. ectvatum*, and which had been named in compliment to Mr. J. O'Brien; the flowers were borne on a stem about 3 feet in length, and were intermediate in size between the parents, the colour rosy-purple, lip fringed as in *ectvatum*, and the yellow crest being taken from the other parent. There were eight expanded flowers and several buds. They also showed *Dendrobium porphyrogastrum* (Huttoni × Dalhousieanum), pale pink with a darker lip; also *Anguloa intermedia* (Clowesii × Ruckeri), which was pale red-cream outside, spotted over the interior surface with "crushed strawberry," thereby partaking of the colours of both parents.

From the Royal Gardens, Kew, there was sent a very interesting collection of plants, including some good Orchids: *Disa racemosa*, recently illustrated by us (see p. 593), which is to many people more pleasing than *D. grandiflora*, on account of its soft rosy-purple hue; *Diaerium bicornutum*, a plant with terete pseudobulbs 9 inches long, flowers white, with

faint purple spots on the labellum; *Masdevallia triaristella*, with flowers about two-thirds of an inch in length of the body, and about a quarter of an inch wide, red-brown internally, exterior, and tails yellow—a quaint looking plant, attaining a height of about 3—4 inches. Another noteworthy plant was *Haberlea rhodopensis*, a Gesneraceous plant, half-hardy, bearing three to five flowers in a peduncle of about 5 inches, the lobes of the corolla are white, throat yellow, tube lilac exteriorly, leaves radicle; it has been growing on the rockery at Kew; *Onosma tauricum*, a yellow Boragewort; *Phaius Manni*, segments brown, the central lobe of the lip long and white, with a red-brown throat; the old *Exacum macranthum*, which is highly decorative, and of such a bright blue; also *Lotus peliorhynchus*, a native of Teneriffe, shown as a basket plant, for which purpose it is eminently adapted with its long racemes of red Pea-like flowers.

Messrs. Kelway & Sons, Langport, contributed a goodly collection of Tree Peonies (cut blooms), mostly their own raising, in all nine boxes, which formed one of the attractive sights of the display, and a Silver Banksian Medal was awarded. The following were conspicuous varieties:—*P. moulan simplex*, single, white with crimson base and centre, stamens bright yellow (very pretty); *Osiris*, double, very distinct, rich deep crimson-red almost black; *Triomphe de Vandercrussen*, large and double, pale rose; *Caroline*, double, pale flesh, fading to white; *Loudonia*, pale pinkish-purple, and good in form; *Reine Elizabeth*, bright pink; and *Mrs. Lowe*, of a similar character, but darker in tint; *tenuifolia fl.-pl.*, bright crimson, was the best herbaceous form. This firm also sent *Abutilon vitifolia*, with a pure white flower, and the corolla opened flat so that it reminded one of *Anemone japonica*. Certificated as a good half-hardy plant.

Messrs. H. Cannell & Sons, Swanley, Kent, sent a collection of forty varieties of *Calceolarias*, exhibiting evidence of fine culture and displaying great range in colour; the individual flowers were large and freely produced. (Silver Banksian.)

Mr. Gordon, Twickenham, received a similar award for a collection of ornamental foliaged Maples arranged with Tree Peonies, which made a very pretty group. These Maples are exceedingly pretty, and good effects are to be obtained by employing the hardiest of them in shrubberies. One of the Peonies, *Prince Albert*, was certificated. It was a double rich rosy-crimson flower.

A Bronze Banksian Medal was given to Mr. J. Forbes, Baccluch Nurseries, Hawick, N.B., for a good and varied collection of about a hundred varieties of fancy Pansies and Violas, which were exhibited on shoots of the plant; not merely the cut flowers lying flat on a board, which destroys all gracefulness. There were many excellent flowers, of which we are only able to enumerate a few of the best:—*Prize-taker*, deep brown blotches, yellow rim, and purple margin; *Bessie Bell*, deep purple, pale straw border; *G. O. Trevelyan*, rich purple-brown self; *Astion* (*Viola*), rich purplish-blue self; *A. McKinnon*, rich claret self; *Gold Digger*, red-brown self; *Mrs. J. Cockburn*, deep purplish-brown, yellow margin to lower part of the flower; *Arabe*, purple margin, pale claret suffused on white; and *W. Dean*, deep purple-brown, centre bright yellow, with the margin of the upper petals purple-brown.

Messrs. J. Laing & Sons, Forest Hill, staged a capital group of plants, and received a Silver-gilt Banksian Medal. *Caladiums* were a leading feature in this exhibit, and numerous varieties were shown, a Certificate being awarded to *Comte de Germiny*, red leaf, lighter spots and darker nerves. There was the new hybrid *Rose*, *Madame G. Bruant*, illustrated in our columns for February 11, p. 163, which is very sweetly scented. *Gloxinia virginalis*, with white erect flowers. *Begonia* *Baroness Rothschild*, pale flesh, almost white, with a crimson margin; *B. Princess Mand*, double white, full, and having no guards; also *Geonomas*, *Adiantums*, *Cliveas*, &c.

G. F. Wilson, Esq., F.R.S., Weybridge, showed *Pinguicula caudata* in flower, and also *Primula Reedii*, *P. glabra*, *P. obtusifolia*, *Lilium Thomsonianum*, and *Roses*. A *Rose* (*T.*), *Sappho*, was shown from Messrs. W. Paul & Son, Waltham Cross; it has been previously referred to.

Messrs. Paul & Son, Cheshunt, Hert's, contributed a group of hardy plants of great interest. *Arnebia echioides* was represented by a good plant; also, *Gemm miniatum*, *Leontopodium sabecum*, *Eritrichium nanum*, about 1 inch high, with a flower like that of the *Forget-me-Not*—a very pretty little thio; also *Polemonium himalaicum*, *Phlox*

Douglasii, *Cortusa matthiola grandiflora*, and many others of equal interest.

A few Carnations were shown by Mr. Hall, Cambridge, and Mr. Driffield, gr. to H. K. Mayor, Esq., Winchmore Hill, N. H. Scott, Esq., Wimfield, sent a good form of *Odontoglossum Andersonianum*.

Mr. F. Ross, Pendell Court Gardens, Blechingley, showed *Prostanthera lasianthos*, a beautiful shrub for the warm greenhouse. A plant struck from a cutting about two years ago is now 5 feet high, and laden with delicate lilac flowers. It is one of those old things which deserve to be brought forward again. *Alsine verna*, fl.-pl., a double white form, was shown by Messrs. Froebel & Co., Zurich, Germany.

FIRST-CLASS CERTIFICATES.

To *Caladium Comte de Germiny*, from Messrs. J. Laing & Son.

To *Begonia Baron Rothschild*, from Messrs. J. Laing & Son.

To *Begonia Princess Mand*, from Messrs. J. Laing & Son.

To *Harberlea rhodopensis*, from Royal Gardens, Kew.

To *Rose* (*Tea*) *Sappho*, from Messrs. W. Paul & Sons.

To *Peony* (*tree*) *Prince Albert*, from Mr. W. Gordon.

To *Arnebia echioides*, from Messrs. Paul & Sons.

To *Anguloa intermedia*, from Messrs. Veitch & Son.

To *Epidendrum James O'Brien*, from Messrs. Veitch & Son.

To *Prostanthera lasianthos*, from Mr. F. Ross.

To *Cypripedium bellatulum*, from Messrs. Hugh Low & Co.

To *Alsine verna plenissima*, from Messrs. Froebel & Co., Zurich.

To *Disa racemosa*, from Royal Gardens, Kew.

To *Aerides Fieldingii alba*, from Baron Schroder.

To *Abutilon vitifolium*, from Messrs. Kelway & Sons.

Fruit Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. J. Lee, W. Marshall, G. T. Miles, J. Burnett, A. H. Pearson, P. Crowley, J. Cheal, and T. B. Haywood.

Mr. D. Campbell, Priory Gardens, Rochampton, had a fine lot of *Asparagus*, and also a brace of *Tender* and *True Cucumber*, both in excellent condition and well grown. Mr. A. Ward, Stoke Edith Park Gardens, sent seedling *Broccoli* of average merit; *Tomatos*, *Hackwood Park*, were splendid from Mr. J. Bowerman, gr. to C. Hoare, Esq., *Hackwood Park*, *Basingstoke*, the fruits being large, fine, and well coloured. H. Merryweather, Esq., *Southwell*, sent *Apple Banbury Seedling*, which had been well kept.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

MAY 18 to 25.—The Council and Mr. Findlay must be congratulated upon a charming exhibition; and especially upon the display made in the spacious covered avenue, formerly known as the Annex. In the place of the framework covered with canvas there is a noble glass-rooted corridor, with a hall beyond; and in the former, on the sloping banks at either side and circular groups in the centre, can be staged everything for which room cannot be found in the new plant-house. In the hall, fruit, cut flowers, alpine plants, &c., found a place; and the corridor and hall supplies convenience for exhibitions at any season of the year, the like of which cannot be found elsewhere in the country. In the fine plant-house the visitor missed the huge foliage plants shown by Messrs. Schloss, Rylands, and others; and the splendid *Dracenas* and *Crotons* usually sent by Messrs. R. P. Ker & Sons, Liverpool, were wanting. Still there was an imposing display, grouped, as usual, with excellent taste and judgment by Mr. Findlay. Herbaceous and bulbous plants were very fine; but alpine fell considerably below their usual fine quality, and not a few appeared as if they had been pushed on into flower under glass. Fruit was good for the season; *Pine-apples* were a leading feature.

The weather was gloriously fine—a Whitsuntide summer—and the visitors were able to enjoy the beauty of the renovated gardens now to be seen in all the glory of their rejuvenescent spring tints. There was no lack of company upon the two open-

ing days. The Manchester public certainly appear to visit and appreciate their flower shows when the weather is at all favourable. The judges' luncheon was specially attractive, owing to its being also in celebration of the coming of age of the Society; and there was a large company under the presidency of the popular chairman of the committee, Mr. Joseph Broome, Mr. Samuel Barlow being his *vis-a-vis*. This took place in the new dining-hall. The after-dinner speaking was heard under the disadvantage of the acoustic properties of the building.

ORCHIDS.

Amateurs.—In the class for the best collection of Orchids, Ferns, Palms, and other decorative plants mixed together and arranged for effect, there were three competitors; the positions, however, in which the plants were to be staged were very dissimilar, one occupying by far the best position at the end of the large exhibition house, another a much narrower space, with two or three iron columns in some degree spoiling the effect; the third competitor having simply a portion of a table in the middle of the house. The successful competitor was A. Heine, Esq., Fallowfield (J. Craggs, gr.), whose group was capitally arranged, the centre being an immense *Dendrobium fimbriatum oculatum* full of flower-spikes, many in bloom and others yet to open. Almost immediately in front of this was a fine basket of *Dendrobium devonianum*, with over twenty pseudobulbs full of flower. These were slightly raised and bent over the basket on all sides, making a very pretty effect. The whole of the space was covered with Palms, Ferns, &c., of medium size, numerous *Cattleya Mossie* and *C. Mendelii*, *Oncidiums*, with their long arching sprays of flowers; *Odontoglossums* in many species and varieties, two very noticeable plants being *O. citrosimum* at the extreme ends so upraised that the pendulous spikes were just above the green ground of the group. Several large masses of *Dendrobium Wardianum* were used at the back. These were full of flower, but lacked colour. The 2nd prize fell to T. Slatter, Esq., Stand, near Manchester. The group was much more closely set up, less green being used, making the Orchids appear a little cramped. Good plants of *Crotons* were worked in amongst the showy *Cattleyas* and *Laelias*; some good *Dendrobiums*, notably fine forms of *thyrsoiflorum* and *Devonianum*, a very choice lot of hybrid *Odontogloss*, also a distinct pale form of *Cattleya Lawrenceana*, several good baskets of *Odontoglossum Rossi major* and *membranaceum*, and capital blocks of *Sophronites grandiflora*, with a dozen flowers on them were nicely hung about overhead. The Duke of Sutherland, *Trentham* (Mr. P. Blair, gr.), was 3rd. Some choice things were in this group, notably the *Masdevallias*. These plants were small, but the varying shades of purple and crimson, lilac and scarlet, were much commented on. Many good forms of *Odontoglossums*, *Dendrobium Ainsworthii*, and *D. A. roseum* were also observed.

In the class for twelve Orchids Mr. Heine was again 1st; in fact, in the other classes for six, ten *bona fide* specimens, ten *Cattleyas*, and three *Vandas*, the same exhibitor carried off 1st prizes, showing uniformly good specimen plants, healthy and full of flower.

In the class for twelve, Mr. Heine's group contained *Laelia purpurata Aurora*, a lovely pale form, with thirteen spikes; *Dendrobium densiflorum*, with fifty spikes; *Vanda teres*, with twenty-five spikes; *Cattleya Mossie*, with fifty flowers; *D. chryso-toxum*, with twenty spikes; *Vanda suavis*, with three spikes; *Calanthe veratrifolia*, with sixteen spikes; *Cattleya Skinneri* had twenty-five trusses of fine flowers; *D. thyrsoiflorum*, twenty spikes; and *Laelia purpurata alba*, a grand broad-flowered form, had eleven spikes, &c. Mr. R. Elphinstone, *Stretford*, was 2nd, with fine plants of *Dendrobium Devonianum*; *D. Wardianum*, twenty-five flowering bulbs; *Cattleya Mendelii*, *Cypripedium villosum*, with twenty flowers; *C. Hookeri*, with twelve flowers; *Laelia purpurata*, twenty spikes; *Odontoglossum facetum*, with six spikes; *C. citrina*, an immense plant on a block, carried quite twenty blooms; *Cattleya Skinneri* had twenty-four spikes, and there was a fine piece of *C. Warneri*, besides others.

In the class for six, Mr. Heine had no competitor; his plants were of large size, notably *Dendrobium densiflorum*, with fifty spikes; *Cattleya Mossie*, with the same number of flowers; *C. Mendelii*, with forty blooms; another large *C. Mossie*, and a fine *Laelia purpurata*; *Calanthe veratrifolia*, with twelve spikes of its pure white flowers. The ten *Cattleyas* with which the same gentleman secured 1st were *C. Mossie*, forty flowers; two

other *C. Mossiae*, almost as large; three *C. Mendelii*, of different forms; *C. Skinneri*, with fifteen spikes; *C. Skinneri alba*, with nine flowers; *C. Schroderi*, with four blooms; and one other.

With three *Vandas* (all varieties of *suavis*), among them being the *Gottschalkii* variety, Mr. Heine was the 1st and only exhibitor.

In the class for ten *bound file* specimens one other group was staged. Mr. Heine was far ahead, having *Oncidium Marshallianum*, two fine spikes; *Cattleya Mendelii*, forty flowers; a dark form of *Laela purpurata*, with five spikes; *Angloa Clowesii*, with sixteen flowers; *Calanthe veratrifolia*, twelve spikes; *Vanda tricolor cinnamomea*, *Laela purpurata alba*, *C. Mossiae*, with fifty flowers; and *Dendrobium thyrsoiflorum*, with twenty spikes. Mrs. Hodgkinson, Bowdon (D. Boardman, gr.), was 2nd, having a fine *Oncidium sphacellatum*, good; *Cattleya Mossiae*, *Laela purpurata*, *Lycaste Skinneri*, and *Dendrobium Falconeri*.

Nurserymen.—In these classes Mr. H. James, West Norwood, staged the only group of Ferns, Palms, and Orchids, and was awarded 2nd prize. His plants were small, and included *Cattleyas*, *Epidendrum vitellinum majus*, *Laelias*, *Odontoglossum crispum* and *Miltonia vexillaria*; also a *Saccolabium praeorsum*, it being almost the only specimen of this species in the exhibition. Mr. James was 1st with ten Orchids, staging good plants of *Cymbidium Lowi*, a very fine variety, carrying four long spikes; *Dendrobium nobile*, finely bloomed; *Oncidium macranthum*, *Laela purpurata*, *Masdevallia ignea* and *M. Veitchii*; also *Cattleya Mossiae*, *C. Mendelii Lawrenceana*, and *Oncidium Marshallianum*. In the group of Mr. J. Cypher of Cheltenham, who was 2nd, was a large *Cattleya intermedia*, full of flower; *Calanthe veratrifolia*, *Cattleya Mossiae*, *Miltonia vexillaria*, *Dendrobium densiflorum*, *D. thyrsoiflorum*, *Odontoglossum crispum*, full of spikes; &c.

Mr. B. S. Williams, Victoria Nurseries, Holloway, showed a very large assortment of *Amaryllis*, Ferns, Orchids, and *Sarracenias*. Among the Orchids we noticed *Oncidium concolor*, *O. sarcodes*, with many fine spikes; *Cypripedium Selligerum*, *C. vernixium*, *C. Swaniannum*, *C. callosum superciliale*, *C. Argus*, *C. caudatum* and *C. roseum*, *Cymbidium Lowi*, *Odontoglossum polyanthum*, *O. citrosimum* in quantity, and *Calanthe Dominiana*.

Messrs. F. Sander & Co., St. Albans, exhibited several very distinct hybrid forms of *Odontoglossum*, and some fine cut blooms of *Cattleyas* and *Laelias*. The *Odontoglossums* included *Whillansianum*, *gemmatum*, *crispum guttatum splendens*, *c. album marginatum*, and *c. maculatum*; a very large form of *Cypripedium ciliolare* named *St. Albans var.*, was also among them. Mr. J. Charlesworth, Heaton, near Bradford, had a very nice group, which included *Odontoglossum Harryana* in two distinct forms; some grand hybrids of *O. crispum*, also *Cattleyas*, *Masdevallias*, *Oncidium macranthum*, *Angraecum Leonis*, *Cypripedium Godefroyi*, *C. niveum*, and *C. Warneri*.

The Liverpool Horticultural Company (J. Cowan) showed a very extensive collection of Orchids, Ferns, and Palms; and of good things amongst them were—*Dendrobium Bensoniae* full of flower; *D. litaeiflorum*, *D. Devonianum*, *D. Jamesianum*, the rare *D. Veitchianum*, *Odontoglossum crispum*, *O. Cervantesii*, *O. Hallii*, and many fine pieces of *Chysis bractescens*.

Mr. W. Owen, Hartford Nursery, Northwich, showed numerous cut blooms of *Cattleya Mossiae* in variety, *C. Mendelii*, *Odontoglossum crispum*, *Lycaste Skinneri*, &c. These were shown in specimen glasses with small Ferns placed between them, and were very effective.

STOVE AND GREENHOUSE PLANTS: FINE-FOLIAGE PLANTS, FERNS.

Amateurs.—These plants were not so fully shown as has been the case in years gone by. The Messrs. Cole & Son, Nicholls, Stevenson, and Schloss, have passed away, and their places have not been filled. The classes these famous exhibitors used to fill were not, in some cases, contested at all. S. Baerlein, Esq., Didsbury, (Mr. G. Williams, gr.), takes 1st for ten fine-foliage plants, in which we observed a large and well-folged *Dion edule*, *Cordylina indivisa*, *Kentia*, *Eucephalartos*, &c. The same exhibitor was 1st for eight stove or greenhouse Ferns, showing *Cibotium regale*, *Dicksonia antarctica*, *Davallia polyantha*, *Goniophlebium Reinwardti*, *Cyathea Burkei*, &c. Mr. A. Birley, Pendleton, was 2nd.

The class for Azaleas was very poorly represented, no good plant appearing in the three collections. S. Baerlein, Esq., was awarded 2nd, the 1st prize being withheld. With six *Ericas* the same exhibitor

was 1st with nice plants of *E. Spenceriana*, *E. ventricosa coccinea minor*, *E. affinis*, *E. tricolor*, &c. S. Baerlein, Esq., was 1st with four *Yuccas*, four Palms, and six *Dracaenas*. In the latter class he had *D. Lindenii recurvata*, *D. Leopoldi*, *D. Goldiana*, *D. Rossi* and *D. Cooperii*; Colonel Wingfield Shrewsbury was 2nd.

S. Baerlein, Esq., was again 1st for a group of miscellaneous plants in or out of bloom, arranged for effect and occupying a space not exceeding 150 square feet. This was an excellent arrangement, the bright-coloured plants standing out well above the green below, which had a somewhat undulated surface. *Rhodanthes*, *Hydrangeas*, *Gladiolus*, &c., were freely employed below and among the lower plants. These groups, of which there were several, formed a capital feature in the long corridor adjoining the "exhibition house."

The hardy Ferns were in good condition, the 1st prize falling to A. Birley, Esq., who staged nice plants of *Lastrea filix mas*, *Bollandiae*, *Athyrium femina grandiceps*, *A. f.-f. Fieldiae*, *A. f.-f. Craigii*, *A. f.-f. plumosum*, *A. f.-f. Iodeoides*; *Polystichum angulare proliferum*, and *Osmunda regalis purpureum*. Mr. Hodgkinson was 2nd, with nicely-grown plants, and had in his group *Oncoclea sensibilis*, *Osmunda gracilis*, and several good *Athyriums*.

Gloxinias were much better than usual, Mr. R. Elphinstone winning with plants full of bloom; Mrs. Sargent Sale, was 2nd.

Nurserymen. In these classes Mr. J. Cypher was 1st for ten stove and greenhouse plants in flower, Mr. H. James coming 2nd. In the former group were plants in Mr. Cypher's usual good style of culture—large specimens full of bloom, prominent among them being an immense *Pimelea*, with a diameter of 6 feet, full of flower; *Aphelaxis macrantha purpurea*, *Darwinia tulipifera*, *Anthurium Scherzerianum* Wardi, with eighteen spathes of immense size; *S. Cypheri*, a very good form; *Erica ventricosa magnifica*, grandly bloomed; a large *E. Cavendishii*, two good *Azaleas*, and others. Mr. James had good plants somewhat smaller, among them being a capital *Ixora*. Mr. Cypher was again to the fore with eight fine-foliage plants, staging *Cordylina indivisa*, *Cycas circinalis*, *Kentia Forsterianiana*, &c. The same positions were taken by these two exhibitors with six *Ericas*, plants small though well-bloomed—*depressa*, *profusa*, *Queen Victoria*, *Aitoniana major*, *Cavendishii*, and *ventricosa* in different forms being present.

Roses.—For a group of thirty Roses in any size pot including standards, Messrs. G. Paul & Son, Cheshunt, were 1st—Paul Néron, Celine Forestier, Lord F. Cavendish, Maréchal Niel, Merveille de Lyon, Ulrich Branner, Marie Baumann, Etienne Levet, White Baroness, were among the most prominent. Mr. W. J. Williams, Stockport, had a capital lot, much less in size, but clean and healthy, with from twelve to twenty flowers on each. Messrs. G. Paul & Son were 1st again for twenty Roses in pots not more than 9 inches across. This was a very nice lot, Mons. Furtado, Madame Cusin, Edward André, Dupuy Jamain, Lady Alice, Alba rosea, and Madame Gabriel Luizet, &c., were in excellent form. Mr. W. Williams 2nd.

In the amateurs' division Mr. James Brown, Heaton Mersey, was 1st, with some well grown and bloomed specimens, the leading varieties being Marie van Houtte, Mad. C. Joigneaux, Mad. Hyp. Jamain, Marguerite de Roman, Marie Ducher, François Levet, Madame Lacharme, &c., 2nd, Mr. Thomas Dickens, Higher Broughton.

Pelargoniums.—Messrs. Charles Rylance & Co., nurserymen, Ormskirk, had, as usual, some very fine specimens, the leading varieties being Corsair, Gaiety, Volante nationale alba, extra fine; Kingston Beauty, Edward Perkins, &c. 2nd, Messrs. R. Fleming & Son. The only exhibitors of eight fancy varieties were Messrs. C. Rylance & Son, who had nicely-grown and bloomed specimens of Ellen Buck, King of Fancies, Cloth of Silver, Mrs. A. Wigan, &c.

Pansies in Pots.—Of these there was a remarkable display, some one hundred and seventy pots being staged in the various classes. The practice of making up specimens is permitted; that is to say, a dozen or so of rooted cuttings, each bearing one or more fine flowers, are placed in an 8-inch pot, and when this is well done, a really remarkable display is produced. The trade contributions were particularly remarkable for their effect.

The best twenty specimens of show varieties came from Mr. S. Robinson, nurseryman, Sale, who had George Rudd, Y.S.; Dr. Hardy, D.S.; Lord Derby, Y.G.; Ebor, Y.G.; Lady Derby, Y.G.; Couliffe

Brooks, Y.G.; Lizzie Bullock, Y.G.; Othello, D.S.; Captain Speirs, W.G.; and Cloth of Gold, Y.S., being the leading varieties. 2nd, Mrs. Eliza Mellor, Rose Cottage, Chorlton, who had Amy, Y.G.; May Queen, W.S.; Mrs. Harvey, Y.G.; Sunny Park Beauty, Y.G.; Bluestone, R.S.; Roebuck, Y.G.; Cloth of Gold, Y.S., &c.

In the class for twenty fancy Pansies, Mrs. Mellor staged a superb lot, the leading varieties being Champion's James Donelly, Countess of Strathmore, Walter Houldsworth, Earl of Beaconsfield, Lady Falmouth, John Strachan, George Vaer, and White Lady; 2nd, Mr. S. Robinson, who had capital blooms of Perfection, May Tate, W. A. Dixon, A. McMillan, Walter Shearer, Mrs. James Watt, John Turnbull, &c.

In the class for twenty *Violas* an extra prize was awarded to Mrs. Mellor, who staged nineteen specimens only, one having been perloined the night previously. The leading yellow varieties were Sovereign, yellow; Little Gem, Pilgrimage, and Beauty of Sale, white; Archie Grant, Queen of Blues, and Lilac Queen, blue; Countess of Kintore, and Dr. Hornby, of the Magpie type.

In the amateurs' division, the best six show Pansies came from Mr. James Mellor, Didsbury; Mr. Sergeant, of Sale, being 2nd; and the same exhibitors were 1st and 2nd with the same number of fancy Pansies, in both cases staging fine blooms of the varieties already named. Mr. Thos. Dickens had the best six pots of *Violas*, Mr. W. Hayes, jun., Sale, being 2nd.

Calcocolorius and Cinerarias.—A few groups of these were shown, generally creditably, but not of a nature to call for special remark.

Cut Flowers.—These were limited in quantity, but they made up in quality. The stand, twelve Tea-scented Roses, to which the 1st prize was awarded, came from J. M. Buckley, Esq., Rock Ferry, probably as fine a dozen as was ever staged in competition. They consisted of Princess of Wales, Alba rosea, Madame de Watteville, Grace Darling, Niphotos, Hon. E. Giffard, Comtesse de Naddillac, Anna Olivier, Souvenir d'un Ami, Marie van Houtte, Madame Welch, and Catherine Mermet. 2nd, W. Ambrose, Esq., Douglas, with a fine dozen Maréchal Niel. In the class for twelve cut Roses, other than Tea-scented, Mr. J. Brown, Heaton Mersey, was awarded a 2nd prize. In the nurserymen's class for eighteen Tea-scented Roses, Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st, with some good blooms shown in duplicate, comprising Maréchal Niel, Niphotos, The Bride, Catherine Mermet, Souvenir de Paul Néron, Perle des Jardins, Sunset, and François Kruger. A Cultural Commendation was awarded to Colonel Winesfield, Shrewsbury, for a box of thirty-six blooms of Maréchal Niel of high quality. A stand of fancy Pansies, from Mr. W. H. Frettingham, nurseryman, Beeston, was commended.

Nurserymen—Pitcher Plants.—The best collection of ten, including *Sarracenias*, came from Mr. A. J. A. Bruce, Chaddle, who had good examples of *Nepenthes Mastersii*, *Sarracenia Mitchelliana*, S. Williamsii, S. Flambeau, S. Maddisoni, S. purpurea, S. Tolliana, S. Chelsoni, S. Wilsoni, S. Swanianna, &c.; 2nd, Mr. H. James, nurseryman, West Norwood, with *Nepenthes Rafflesiana*, N. robusta, N. distillatoria, N. Hookeri, *Sarracenia Atkinsoniana*, S. Tolliana, S. purpurea, S. flava maxima, &c.

Hardy Herbaceous and Bulbous Plants.—In the nurserymen's division Messrs. James Dickson & Sons, Upton Nurseries, Chester, contributed two groups of really wonderful merit, and they made an imposing display in the annexe. In the class for an unlimited collection this well-known firm were 1st, with *Liliums* in variety, *Spiraea aruncus*, *Dielytra spectabilis*, *Carnations*, *Irises*, *Tulips* of various showy species, *Narcissus*, herbaceous *Paeonies*, *Primula japonica alba*, P. Sieboldi in variety, &c.; 2nd, Messrs. Stansfield Bros., Southport. Messrs. J. Dickson & Sons were the only exhibitors of sixty plants, having a very fine lot indeed, in which were *Arundo Donax variegata*, *Hemerocallis Quanso variegata*, *Polemonium Richardsoni*, *Tulipa fulgens variegata*, *Doronicum plantigerum*, *Liliums*, *Funkia Sieboldi*, &c.

In the amateurs' division R. P. Gill, Esq., Sale, was 1st, with thirty plants—a very good lot, including *Spiraea aruncus*, S. palmata alba, *Lilium Harrisii*, P. obconica, *Trollius europaeus*, *Leucium aestivum*, *Spiraea astilboides*, *Carnation Mrs. R. Hole*, *Ajuga genevensis*, &c.

Alpine Plants.—These fell below their usual high quality, having generally a drawn and weedy appearance; while in some of the collections plants in all probability as foreign to the Alps as to the North

Pole were introduced. Messrs. Paul & Son were 1st, with forty plants in or out of flower, having many varieties of Saxifrages, Phlox frondosa, Primula farinosa, Androsace ciliata, Anemone alpina sulphurea, Polygala Chamæubuxus purpurea, &c. 2nd, Messrs. James Dickson & Sons, whose leading subjects were Cypripedium calceolus, C. species, Gentiana verna, Ramondia pyrenaica, Litbospermum prostratum, &c.

In the amateurs' class for thirty plants R. P. Gill, Esq., Sale, was 1st, with Saxifraga cotyledon, Spirea species, with marked foliage, like a Heuchera, and small pink flowers; Silene pendula compacta, Asperula odorata, &c. 2nd, Mr. Sargeant.

Mr. Gill was the only exhibitor of twelve plants, having good examples of Sibthorpia europæa, Saxifraga granulata, S. pyramidalis, S. Aizoon, Antennaria dioica, &c.

Clematis.—The best six specimens in pots came from Mr. Thos. Dickins, Higher Broughton, who had fairly good specimens of Manve Queen, purpurea elegans, Lucie Lemoine, Fairy Queen, lanuginosa candida, and Jackmanni.

Collection of Japanese Plants.—Messrs. John Waterer & Co., nurserymen, Bagshot were the only exhibitors in this class, and their contribution made two fine groups in the corridor. It included finely-developed specimens of Acers, in great variety, Thniopsis dolabrata, Retinospora plumosa, R. plumosa aurea, R. obtusa erecta viridis, R. obtusa variegata, &c., Sciadopitys verticillata, Cryptomeria japonica, Osmanthus variegatus, Juniperus japonica variegata, Taxus japonica, &c.

Hardy evergreen Trees and Shrubs.—Two very large and varied collections of these were staged in the open air. The best came from Messrs. Waterer & Son. Among them were Hollies in variety, and coniferous plants of various types, some of the variegated forms being specially attractive. Mr. W. H. Frettingham, Beeston, was 2nd.

Groups of Plants arranged for effect.—These formed a very fine feature, arranged in sloping banks in the corridor. In the nurserymen's division Messrs. R. P. Ker & Son, nurserymen, Liverpool, were 1st with a remarkably arranged group, Maidenhair and other ferns forming the groundwork, with brilliantly coloured Crotons distributed about it; scarlet Azaleas, Palms, &c. 2nd, Mr. James Mason, Ashton-on-Mersey—a good group, but lacking the richness of the preceding.

Fruit.—The dishes of fruit were more numerous than usual; and it was, generally speaking, of good quality. In the collection of eight distinct kinds, Sir J. W. Pease, Bart., M.P., Darlington, was 1st and the only exhibitor; he showed good Black Hamburgs, and Early Frontignan Grapes, Best of All Melon, Hale's Early and Early Beatrice Peaches, James Veitch Strawberry, Court Pendu Plat Apple, and a Pine.

There were no less than nine stands of Black Grapes put up, the 1st prize being taken by W. Brotherton, Esq., Chorley; J. F. Campbell, Uttoxeter, 2nd; and Sir J. W. Pease 3rd. For two bunches of white Grapes P. Thelluson, Esq., Brodsworth Hall, Doncaster, was 1st, with Duke of Buccleuch; W. Brotherton, Esq., 2nd, with Foster's Seedling. For two Pine-apples Mrs. Byass, Tunbridge Wells, was 1st, Sir J. W. Pease 2nd; for one Pine-apple Sir J. W. Pease was 1st.

Twelve pots of Strawberries only brought one competitor, the Duke of Sutherland (gr. Mr. Blair), who was 1st with Sir Harry. The same exhibitor was 1st with a dish of the same variety of Strawberry, fine large fruit, of splendid colour; Mrs. Byass was 2nd. The Duke of Sutherland was 1st with a dish of Cherries. Sir J. W. Pease was 1st with a green-flesh Melon, and also with a dish of Peaches; the Earl of Ellesmere being 2nd in this latter class. Special prizes were awarded to Sir J. W. Pease for Melons, Cucumbers, Citrons, and Lemons; to Colonel Legh, of High Leigh Hall, for Seakale; Mr. W. Brotherton, for Tomato, Moor's Gem; and Mr. R. P. Gill, for Mushrooms.

Miscellaneous.—Messrs. Ryder & Son, nurserymen, Sale, staged a large group of seedlings of Primula Sieboldi, and Certificates of Merit were awarded to the following:—Bruce Findlay, bright purple; alba magnifica, white, charmingly frimbriated; Mrs. Ryder, white, the reverse pale pink; and Leo H. Grindon, rosy-purple. They also staged a good lot of cut Pelargonium blooms. Certificates of Merit were awarded to Messrs. Paul & Son, for H.P. Rose Lady Alice, and to Iris paradoxa, a dark flowered species, with a singular-looking maroon coloured lip.

THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending May 21, is furnished from the Meteorological Office:—

"The weather has been cloudy and somewhat unsettled in most of the west and north-west parts of the kingdom, but generally fair elsewhere. Thunderstorms were experienced, however, in different parts of the country on the 18th or 19th, those in Scotland being very severe.

"The temperature has continued a little below the mean in England, S.W. and the 'Channel Islands,' but has about equalled the normal for the season in Ireland, while in Scotland and all the other English districts it has been 2° or 3° above. It was very high over Great Britain on the 19th, when maxima of 77° or 78° were recorded in Scotland, and between 77° and 80° in most parts of England. In Ireland, the south-west of England, and the 'Channel

Islands' the maxima for the week were lower, ranging from 67° to 73°. The lowest of the minima were generally registered on the 15th, when the thermometer fell to 31° in England, S.W., to 32° in 'England, E.' and the 'Midland Counties,' and to between 33° and 37° in most other districts. In Ireland and the 'Channel Islands' the lowest reading was 39°.

"The rainfall has been rather less than the mean in 'England, N.E.' the 'Midland Counties,' and 'England, N.W.,' but more in all other districts.

"Bright sunshine shows a considerable decrease on that recorded last week, the percentage of the possible amount of duration, ranging from 25 in 'Scotland, W., to 45 in 'England, E.' and 48 in the 'Channel Islands.'"

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JUNE 2. (AVERAGE OF FORTY-FOUR YEARS.)

Obituary.

FRANCIS RAUCH.—We regret to announce the death, on the 13th inst., of Mr. Rauch, Superintendent of the Imperial Gardens, Laxenburg, Austria. The late Mr. London received assistance from Mr. Rauch and his brother in the production of *The Arboretum et Fruticetum Britannicum*, as well as with other works of a like nature.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

SUPPORTING THE BRANCHES OF LARGE CEDARS OF LEBANON.—I should be glad to have the opinion of gardeners through the *Gardeners' Chronicle* respecting the chaining up of large limbs of Cedars of Lebanon. Having frequently noticed that the branch snaps off just beyond the iron collar at the end of the chain, it has occurred to me that the branches should have more spring, for I find they will come down a great many feet without breaking if allowed more play. Doubtless there is something to be said in allowing the chain to hang loosely, but it is a question with me if it would not be better to let the branches alone, as it is a nice calculation how far the branch will come with its weight of snow without breaking. There are here some very fine old trees very much valued by the owner, and, indeed, they are looked upon as landmarks for miles round. These trees have been much chained up in recent years, but the snow in recent winters has much disfigured one of them. According to my experience, it is only the dead weight of snow that breaks Cedars, no winds injure these giants with their roots far down into the chalk. *W. Waterman, Charleywood Cedars, Rickmansworth.*

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPLES: *Westmeon* and *B. Cuswell*. It is now too late in the season to name these fruits with certainty.

CINERARIAS: *Canon D. P.* We are sorry not to be able to throw any light on the matter. The disease does not look fungoid, nor could we find any insect. The appearances are more those of mechanical injury.

C. VUYLSTEKE: See number for April 28.

DAFFODIL LEAVES: C. W. D. We do not think the injury is due to fungus, but probably to something wrong at the root.

FENUGS ON SAVIN: E. M. Podisoma sabinae, which also attacks the Hawthorn, when it assumes a totally different appearance, and has been named Rostelia.

GARDENERS' ORPHAN FUND: H. J. C. The date has been fixed, but at a much earlier date than that you proposed.

NAMES OF PLANTS: F. Russell. 1, Ranunculus amplexifolius; 2, Mesembryanthemum Cooperi; 3, Aubrietia graeca; 4, Spiraea sp.: send better specimen; 5, Daphne cneorum.—Constant Reader. 1, Doronicum austriacum; 2, Berberis stenophylla; 3, Kerria japonica; 4, Ceanothus rigidus.—L. H. 1, Mackaya bella; 2, Davallia tenuifolia; 3, Dielytra eximia; 4, next week; 5, Selaginella umbrosa.—P. O. M. 1, Berberis stenophylla; 2, the white variety of Lamium purpureum; 3, Stachys lanata; 4, Armeria maritima; 5, Saxifraga umbrosa; 6, Matricaria inodora; 7, Saxifraga hypnoides; 8, Saxifraga hypnoides var.; 9, Iberis coriifolia.—J. W. Adonis autumnalis (Pheasant's-eye), cornfield weed.—J. B. 1, Corydalis flava; 2, next week.—W. W. Claytonia perfoliata, a garden escape.—L. H. Erica moschata; H. C. 1, Lastrea lepida; 2, Selaginella Wildenovii; 3, Adiantum affine; 4, A. hispidulum; 5, A. venustum; 6, Claytonia perfoliata.—C. J. Rowe. Odontoglossum Andersonianum.—W. G. Odontoglossum pulchellum majus.—F. 1, Mesembryanthemum, next week; 2, Fuchsia, next week; 3, Onion plant, Ornithogalum longe-bracteatum.—C. E. F. Asplenium Hemionitis.

ODONTOGLOSSUMS: A. M. Fair forms of each.

ORCHID LEAVES: J. G. W. The leaves have been infested by thrips, although none of the insects were found on them.

PEACH LEAVES DISFIGURED: W. S. Arises from faults of management. The foliage is thin, and very tender, and the holes burnt in it are caused by the sun shining on them while wet.

PICEA AMANENSIS: J. J. F. Many thanks. You can adopt which nomenclature you prefer. English nurserymen now stand alone in calling Spruces Abies, and vice versa. All modern botanical books and especially the standard Genera Plantarum of Bentham and Hooker, call Silver Firs Abies and Spruces Abies. The plant was figured and described in Gardeners' Chronicle, January 24, 1880, and under whatever name grown is one of the hardiest and most ornamental species.

SHEDDING OF THE FRUITS OF NEGRO LARGO FIG: F. L. This may be due to faults of management, such as endeavouring to ripen the largest Figs formed last autumn instead of rubbing them off; dryness at the root, overcrowding of the shoots; but as you give no details of the methods of cultivation pursued, we are unable to tell you, with any certainty, the cause of the mischief.

SHRUBS: A. Rides. Ilex dipyrrena. Send the Rhododendron hybrids to some nurseryman who grows these plants extensively.

TWIN CUCUMBER: D. T. Not uncommon; is often sent here.

WEED DESTROYER: D. & S. Your letter is, unintentionally no doubt, insulting. The editorial and advertising departments are quite distinct, and publication in the one does not in any way pledge us, still less our correspondents, to say anything about the matter in the other. Send a sample to the Royal Horticultural Society's garden at Chiswick, and an impartial trial will be given, on which we might be disposed to report in due time.

WINE FROM RHUBARB: T. B. B. It may be made from the juice alone, putting 3 lb. of sugar to the gallon. Let the "must" ferment at first in an open vessel covered with a cloth, which it will do at a temperature of 55°-60° in a short time. The yeast may then be taken off, and the liquid put into a cask, allowing the fermentation to go on, filling up with some that has been reserved. If a still wine be required, let the fermentation work itself off entirely. The wine should not be used for two or three years, and care must be taken to fill up the cask with some of the wine which has been kept in bottles, once a month at least. It will be like dry sherry, and without any perceptible flavour of Rhubarb. The same kind of juice

may be made into a champagne, by bottling off the wine before fermentation has quite ceased. A weaker wine may be made by cutting up the stalks of Rhubarb, smashing the pieces with a pestle, to every 5 lb. weight of stalk adding 1 gallon of cold water, and sugar at the same rate as above given. The methods afterwards pursued are identical with those already given, and as a summer drink this weaker wine can be recommended in preference to that made from the juice alone.

COMMUNICATIONS RECEIVED.—D. M.—C. Naudin.—W. R.—G. F. W.—M. D.—J. Wood (many thanks).—J. Rashleigh (many thanks).—W. Fawcett, Jamaica.—C. V.—Weedland, Hanover.—W. B.—D. & S.—A. H. S.—E. H. K.—J. H. Goodacre (next week).—S. F. L.—R. B. W.—G. F. W.—G. S.—E. B.—E. & F. N.—F. R.—E. H. C.—W. B.—D. T. F.—J. K.—J. D.—H. M.—D. B.—W. S.—J. B. T.—A. D.—J. C.—J. R.—H. T.—G. Swales.—A. D. W.—W. E.—J. W. O.—G. M.—J. S.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

SEEDS.

LONDON: May 23.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., state that the seed market to-day presented quite a holiday appearance, and nothing of interest took place, transactions being very few. Small orders still drop in for Clover and Grass seeds, the sowing season this year being unusually protracted. As regards values there is no appreciable change; stocks on hand remain in moderate compass. Advances from America report the recent advance in Clover seed as fully maintained, and some speculative purchases have been taking place. Rape seed continues in favour, and higher rates are anticipated. Mustard also sells freely. Blue Peas move off on former terms. Hemp and Canary seed dull. Scarlet Runners are still inquired for.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: May 23.—Good supplies of all kinds of greenstuffs; demand fairly brisk. Old Potato trade still stagnant, best sorts only being in request. Quotations:—Asparagus, 1s. 3d. to 1s. 9d. per bundle; Cauliflowers, 4s. 6d. to 6s. 6d. per tally; Cabbages, 4s. to 6s. 6d. do.; Spinach, 1s. to 1s. 6d. per sieve; Greens, 3s. 6d. to 6s. 6d. per dozen bunches; Turnips, 1s. 9d. to 2s. do.; Carrots, 2s. 3d. to 3s. do.; Mint, 1s. 6d. to 2s. do.; Parsley, 1s. to 1s. 6d. do.; spring Onions, 1s. 6d. to 2s. do.; Turnip Radishes, 6d. to 1s. 3d. do.; Mustard and Cress, 2s. per dozen baskets; Rhubarb, 1s. to 2s. per dozen bundles; Horse-radish, 10d. to 1s. per dozen; Endive, 8d. to 1s. do.; Seakale, 1s. to 1s. 6d. per punnet; Beetroot, 8d. to 1s. per dozen; Cabbage Lettuces, 8d. to 1s. do.; English Onions, 6s. to 7s. per cwt.; foreign, do., 4s. to 5s. 6d. per bag of 110 lb.; Carrots, 90s. to 120s. per ton; English Apples, 9s. to 10s. per bushel; American, do., 20s. to 25s. per barrel.

POTATOS.

STRATFORD: May 22.—Quotations:—Old Scotch Magnums, 65s. to 80s.; do. Regents, 60s. to 80s.; English Magnums, lightland, 50s. to 70s.; fenlands, 35s. to 50s. per ton. New: rounds, 9s. to 11s.; do., kidneys, 10s. to 12s. per cwt.

THE LINNEAN SOCIETY CENTENARY.—The first act of this interesting ceremonial passed off very successfully on Thursday. After a brief but satisfactory financial statement from the Treasurer, and a similar account of the Linnean collections, and of their history, rendered by the Botanical Secretary, the President, Mr. Carruthers, gave an address in which the history of the Society was sketched, and tribute paid to the illustrious dead. Reference was also made to the founder of the Society, Sir James Smith. At the close a vote of thanks to the President was proposed by Sir John Lubbock, and seconded by Dr. Masters.

Professor Fries' address on the labours of Linnæus was then read, the elegance of the language testifying to the fidelity of the translation. This address was the more interesting as written by the present occupant of Linnæus' professorship at Upsal. Sir Joseph Hooker then sketched the botanical career of Robert Brown, bringing into prominence the sagacity, accuracy, and precision of the "Prince of Botanists." Professor Flower followed with a tribute to the life and works of Charles Darwin couched in elegant language. Mr. Thistelton Dyer happily portrayed the leading features of the career of Bentham, after which Professor Mivart proposed a vote of thanks to the speakers, and then came the most interesting part of the proceedings—the presentation of the newly instituted Linnean Medals to Professor Owen and to Sir Joseph Hooker, as representatives of zoology and botany respectively. Mr. Carruthers' address to the two recipients was a well-balanced, judicious, and appropriate performance, and the two medallists, who met with a most gratifying reception on the part of the Fellows, expressed their acknowledgments. The venerable Professor Owen still retains his musical voice, but the emotion he evidently felt forbade the expression of more than a few words of gratitude; and the same may be said of Sir Joseph Hooker, whom Mr. Carruthers aptly described as having trod firmly in the footsteps of Robert Brown. A dinner in the evening, and a *conversazione* on Friday, form the complement to this remarkable ceremonial.

MARKETS.

COVENT GARDEN, May 24.

Patces remain much the same, with the exception of Strawberries, which, owing to the improvement in the weather, have reached us in large quantities during the holidays, and have met with a bad market. James Webber, Wholesale Apple Market.

HOT-WATER PIPES, CONNECTIONS,

and all Castings for Horticultural Purposes.

HOT-WATER and HOT-AIR APPARATUS Erected Complete, or the Materials supplied.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOYER, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CORRY, SOPER, FOWLER & CO.

(LIMITED),

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

CARPENTER, PAINTER, &c., Estate or otherwise.—Age 36, married; respectable; abstainer. Good references.—OCSLEY, 6, New Buildings, Alfred Street, Taunton.

HOLLOWAY'S PILLS.—No Mystery.

—Whenver the blood is impure or the general health is impaired the human body is predisposed to attacks of any prevailing epidemic. The first indications of faulty action, the first sensations of deranged or diminished power, should be rectified by these purifying Pills, which will cleanse all corrupt and reduce all erring functions to order. These Pills counteract the subtle poisons in decaying animal or vegetable matter, and remove all tendency to bowel complaints, biliousness, and a host of annoying symptoms arising from foul stomachs. The fruit season is especially prone to produce irritation of the bowels and disorders of the digestive organs; both of which dangerous conditions can be completely removed by Holloway's corrective medicine.

Friday Next.

CATLEYA MENDELII.

A magnificent consignment from a new district. For Sale entirely without reserve.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. G. T. White to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 8, at half past 12 o'clock precisely, without reserve, a magnificent importation of CATLEYA MENDELII, from a new district. The Collector writes:—“These plants could be sold as Cattleya Mendelii grandiflora with guarantee, so great is the difference in the size and quality of the flowers from those of the ordinary form.

The whole of the consignment is offered, and no more will be received this season. The plants are in unusually fine condition, with very broad leaves and sound dormant eyes. On view morning of Sale, and Catalogues had.

Friday Next.

CYPRIPEDIUM GODEFROYE, wonderful Importation, comprising 31 Cases received direct for Unreserved Sale.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 8, at half past 12 o'clock precisely, a splendid importation of CYPRIPEDIUM GODEFROYE, just to hand, in the best possible condition. The Vendors write that the plants differ from those described, inasmuch as these plants will have two flowers on each stalk, and the present consignment will be found to contain the largest specimens ever imported, one mass being 7 feet in circumference, and several others 6 feet; also a few selected ESTABLISHED ORCHIDS, including Cattleya Wagneri and Oncidium crispum grandiflorum.

On view morning of Sale, and Catalogues had.

Friday Next.

CATLEYA SANDEIRIANA.

ODONTOGLOSSUM ALEXANDRE.

MESSRS. PROTHEROE and MORRIS are instructed by Messrs. Shuttleworth Carder & Co. to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY June 8, at half past 12 o'clock precisely, a very fine importation of CATLEYA SANDEIRIANA, extra fine masses, in splendid condition; a grand lot of ODONTOGLOSSUM CRISPUM (Alexandre) of the very best type, and in splendid masses; also a small consignment of O. CRISPUM (Alexandre) from an entirely new district, O. GRANDE, and LYCASTE SKINNERI.

On view morning of Sale, and Catalogues had.

Orchids in Flower.—Special Sale, June 26. MESSRS. PROTHEROE and MORRIS desire to announce that their NEXT SPECIAL SALE of ORCHIDS IN FLOWER will take place as above, for which they will be glad to receive Notice of Entries as soon as possible.

The Downside Collection of Orchids.

PRELIMINARY NOTICE.

HIGHLY IMPORTANT “EIGHT DAYS” SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of

ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from Wm Lee, Esq. (who is selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL by AUCTION, on the Premises, Downside, Leatherhead, about 1 mile from either of the Leatherhead Railway Stations,

On TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 10, 11, 12, and 13, 1888;

and also on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 24, 25, 26, and 27, 1888.

at half past 12 o'clock precisely each day, the whole of this most valuable Collection of ESTABLISHED ORCHIDS.

MASDEVALLIA SECTION

comprises a grand and complete collection of Masdevallias, many of the highest class, and some very rare.

ODONTOGLOSSUM SECTION.

There is a large and very choice collection of the finest varieties in large plants, true to name, and which have been grown at Downside for several years, and are models of successful cultivation.

PHALAENOPSIS SECTION.

Amongst the Phalaenopsis are two plants of P. Brymeriana, also intermedia, Portei, one of the true variety Dayana, and several leucorrhoda and casta.

VANDA, AÉRIDES, and ANGRECUM SECTION.

A grand assortment of these, all in splendid health.

MISCELLANEOUS.

- Maxillaria Sanderiana, five plants (one in flower)
Cymbidium Wallisi, 3 plants
Saccolabium Heathii
Cypripedium Wallisi, two plants
Harrisianum or gigantum album

Messrs. P. & M. desire to mention that no plants will be sold privately, but that the whole will be submitted to public competition.

The collection may be viewed any day prior to the Sale, by cards to be obtained of Messrs. PROTHEROE and MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C. The Catalogue is in hand and will shortly be published. Copies can be obtained on application to the Auctioneers.

Cattleya Mendelii.

Just to hand by SS. “Orinoco,” in fine masses and good condition.

MESSRS. PROTHEROE and MORRIS are instructed by Messrs. Shuttleworth, Carder & Co., to SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C. THE DATE OF SALE WILL BE ANNOUNCED NEXT WEEK.

Langley, Bucks.

ORCHARD and BUILDING LAND, with BRICK EARTH. MESSRS. BUCKLAND and SONS have received instructions to SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY, June 6, 1888, at half past 12 o'clock precisely, in lots, about 113 acres of most valuable FREEHOLD and COPYHOLD LAND, together with a Residence known as “South End Lodge,” Farm Buildings, and Cottages, situate in the parish of Langley, Bucks, intersected by the Great Western Railway and the Grand Junction Canal, and abutting on capital roads.

The Residence stands in the midst of Cherry Orchards of good growth and in full bearing, at only a short distance from the Langley and Slough Stations, and easily accessible for carriage by both railway and canal. The Land is also most suitable for Nursery Market Gardens and Seed Trial Grounds, and much of it contains Brick Earth of the best quality.

Particulars at the Mart; of Messrs. TAYLOR, HOARE and BOX, Solicitors, 28, Great James Street, Bedford Row, W.C.; and of the Auctioneers, 23, Hart Street, Bloomsbury Square, W.C., and Windsor.

H. I. HARDY, F.R.H.S., Stour Valley Nurseries, Bures, Suffolk.

Carnations, Pinks, and Picotees, from Seeds.

The Flower of the Gods!!! (Dianthus: dios, divine, and anthos, flower).

WILLIAM BAYLOR HARTLAND is offering for Summer Sowings his celebrated strain of the above. His "White Rosette" clove-scented Carnation is richly perfumed, and snow-white in colour, resembling a "Rosette," and possessing the valuable property of not splitting in the calyx even in the hottest weather, and for buttonhole work and general cutting purposes is unequalled.

CARNATION, Yellow, Bizarre, and Self, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.

Yellow, Fluke, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.

Hartland's White Rosette, clove-scented, own savings, per packet, 1s.

Scarlet Grenadin, or floribunda coccinea, large packet, 2s. 6d.; per packet, 6d.; beautiful.

Perpetual, or Tree, for pots, superb, per packet, 1s.

PICOTEE, Yellow and White Grounds, 12 superb varieties, 4s. 6d.; mixed, packet, 1s.

PINK, very choicest, mixed. Some single forms will be found included in this choice strain, and they are very beautiful. Per packet, 1s.

Mrs. SINKINS, selected from a lovely non-splitting form of this well-known plant, and own saving, 1s. and 2s. 6d.

*S. Hartland's Mixed Packets of Gloxinia, Primula, Cineraria, and Calceolaria, are unequalled for quality, 1s. 6d. and 2s. 6d. each.

W. BAYLOR HARTLAND, F.R.H.S., Seedsman, 24, Patrick Street, Cork.

MR. J. CHAMBERS, Westlake Nursery, Isleworth, London, W., is offering his new Double VIOLET "VICTORIA." Grandest of all Violets. Three Certificates, first-class. Plant now for getting up Winter Stock. Strong Clumps, 18s. per dozen.

Also offering for the first time his new White VIOLET "SNOWFLAKE," at 12s. per dozen. First-class Certificate, Crystal Palace, May 12. Remittance with all orders.

150,000 Pansies.
PANSIES and VIOLAS.—Having one of the finest collections and largest stock of both Pansies and Violas in existence, we are prepared to supply good, well-rooted plants at the following low price:—PANSIES, in 50 choice, either Show or Fancy varieties, 12s. per 100, 45s. per 1000; in 30 varieties, 10s. per 100, 44 per 1000. VIOLAS, in 12 best varieties, 7s. per 100, 43 per 1000. VIOLAS, all yellow, 8s. per 100, 43 per 1000. Special quotations for large quantities. PENTSTEMONS, choicest varieties out, in 12 or more varieties, 12s. per 100, 45 per 1000. The above are our selection only, 2s. per 100 more will be charged for purchaser's selection. Terms.—Package free for cash with order. FLETCHER, SON AND CO., Florists, &c., Chesterfield.

VERBENAS—VERBENAS.—Purple, White, Crimson, Scarlet, and Pink, 6s. per 100, 50s. per 1000; in twelve best exhibition varieties, 8s. per 100. The above are all good, strong, healthy, well-rooted plants from store pots. Package and carriage paid. Terms cash with all orders. FLETCHER, SON AND CO., Florists, &c., Chesterfield.

BEDDING PLANTS, established, and so sure to give satisfaction. CHRYSANTHEMUMS, the very choicest sorts, in good plants. DAHLIAS, an unsurpassed collection. Descriptive LIST free. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

STOCKS, ASTERS, GOLDEN FEATHER, Lobelia compacta Emperor William (true), Marigolds, Ageratums, Antirrhinums, Nasturtiums King, Jacobea, Everlastings, Chrysanthemums, Celery Plants (reliable), Beet (Dell's Dark), Mimulus. All the above at 3d. per score of 20, carriage free, all transplanted, in boxes. JAMES BROOK, Batley, Yorkshire.—Established 1856.

HARTLAND'S FAMOUS DAFFODILS FOR FORCING PURPOSES.—Special Trade Offer of thirty varieties that W. B. H. grows in large quantities, post-free. The foliage is now (May 20) one mass of green and gold, and the roots going to rest will be harvested under the most favourable conditions, as bulbs that flower early in the South of Ireland, within 10 miles of these, are naturally better adapted for Forcing and Early Work, than what are grown in more northern districts, and where the spring bloom is retarded. Old-Established Seed Warehouse, 24, Patrick Street, Cork.

Verbenas—Verbenas.
WILLIAM BADMAN offers clean, healthy, well-rooted VERBENAS, at 6s. per 100; 50s. per 1000. Purple, White, Scarlet, Rose, and Crimson; or, 1000 Choice Named Sorts for 8s., if post-free 3d. per 100 extra. Packing included. Terms cash. Cemetery Nursery, Gravesend.

NEW COLEUS, "HART'S CONQUEROR."

No collection complete without it. Pronounced to be the best variety of the day.

Messrs. A. HART AND SONS, Florists, 130 and 152, High Street, Guildford, received Vote of Thanks, Royal Horticultural Society, 1887; Certificate of Merit, Guildford Autumn Show, 1887; Commendation, Reading Autumn Show, 1887. *Gardeners' Chronicle*, November 12, 1887:—"A showy variety of Coleus, well adapted for indoor decoration."

For further opinions, see leading horticultural papers, November 12, 1887.

West Surrey Times, November 12, 1887.—Guildford:—"One very attractive feature on Messrs. Hart & Sons' stand was a specimen of their new Coleus; this is surpassingly beautiful, with rich colouring and marking on its fine leaves."

Messrs. H. AND SONS have much pleasure in offering the above Coleus to the Public for the first time, which is a distinct and beautiful variety, with rich colouring and large ovate leaves, deeply scalloped at the margin, and of a deep maroon colour, with a broad lively rose blotch in the centre, and creamy-yellow at the base. It cannot be too strongly recommended. Well-rooted plants in single pots, post-free, 5s. each. Early orders solicited. Cash with order from unknown correspondents. Trade price on application. All orders taken in rotation, and sent at once.

NEW ROSES.

WM. PAUL & SON,

Rose Growers by Appointment to Her Majesty The Queen,

WALTHAM CROSS, HERTS,

RESPECTFULLY SOLICIT ORDERS FOR THE FOLLOWING NEW ROSES:—

DUCHESS OF ALBANY, H.P. (Wm. Paul & Son).—A sport from LA FRANCE, with flowers deeper in colour and larger in size than the parent variety. It has been fully tested at Waltham Cross, and has been greatly admired by all Rosarians who have seen it.

The *Journal of Horticulture* says of this Rose:—"It is totally distinct in colour, both surfaces of the petals being of a rich dark rose tint. In the bud state it is extremely beautiful. For bouquets, button-holes, wreaths, or indeed any decorative purpose it is admirable."

The *Garden* describes the flowers as "of a bright pink shade of colour, large and full, quite distinct from and much better than those of LA FRANCE."

Plants now ready, 10s. 6d. each.

GRAND MOGUL, H.P. (Wm. Paul & Son).—A seedling from A. K. Williams; deep brilliant crimson shaded with scarlet and black. First-class Certificate Royal Horticultural Society.

Plants now ready, 3s. 6d. each.

SILVER QUEEN, H.P. (Wm. Paul & Son).—Silvery blush shaded with rosy-pink, very soft and pleasing; produced in great abundance; quite first-rate.

Plants now ready, 3s. 6d. each.

THE PURITAN, H.P.—One of the most beautiful and valuable of New Roses. White, large, handsome, and sweet; produced in great abundance.

Plants now ready, 3s. 6d. each.

NOTE.—Wm. Paul & Son were the original distributors of this and the two following varieties, and have still the largest stock of the best plants of them:—

MR. JOHN LAING, H.P.—Soft pink, large, and finely shaped, very sweet; free and good.

Plants now ready, 3s. 6d. each.

THE METEOR, H.T.—Deep velvety crimson, of medium size; exceedingly valuable for pot culture and winter-blooming.

Plants now ready, 3s. 6d. each.

The following Roses of recent introduction are also now ready:—

FLORENCE PAUL, H.P. (Wm. Paul & Son).—Scarlet-crimson shaded with rose, 2s. 6d.

CHARLES DICKENS, H.P. (Wm. Paul & Son).—Rose colour, hardy and profuse. A grand bedding Rose, 2s. 6d.

GLOIRE DE MARGOTTIN, H.P.—Dazzling red, 3s. 6d.

MADAME HOSTE, Tea-scented.—Pale yellow, deeper centres. First-class Certificate, Royal Horticultural Society, to Wm. Paul & Son, May 8, 1888, 3s.

THE BRIDE, Tea-scented.—White, very large and full; quite first-rate, 2s. each, 18s. per dozen.

HER MAJESTY, H.P.—Satin-rose, very large, 1s. 6d.

EARL OF DUFFERIN, H.P.—Velvety crimson, shaded with maroon, 3s. 6d.

SIR ROWLAND HILL, H.P.—Maroon, 7s. 6d.

WALTHAM CLIMBERS, No. 1, 2 and 3, 2s. each. Very valuable red, perpetual-flowering, climbing Roses.

The New French Roses of 1888, 3s. each, 30s. per dozen.

The New French Roses of 1887, 2s. each, 21s. per dozen.

All other New Roses at advertised prices.

SATURDAY, JUNE 2, 1888.

GARDENING IN FLORIDA.

MY arrival in Florida dates from April last, I having just landed when the early Peaches had set their fruits, and later ones were blooming. A year's experience and careful enquiry enables me to send you an impartial account of things just as they are.

This portion of the State of Florida is one of the highest above the sea-level, and is about half-way between the Atlantic Ocean and the Gulf of Mexico; it is therefore healthy, and the climate is pleasant. Strong breezes blow almost continually from the Gulf or the Atlantic.

The greater portion of the land is covered with Pine trees, and is of all degrees of fertility, the price ranging from 8s. an acre a few miles out from towns, to £20 an acre within town limits. It is an excellent fruit district, a greater range of varieties of fruits being grown here than in other portions of the State. Amongst the most commonly seen fruits may be mentioned the Orange in variety, such as the Homasassa, Bahia or Navel, Satsuma, Mandarin, Tangierine, King, and many others; Pears—Le Conte, or Chinese Sand, and Kieffer Pear; Peaches Peen Tau, Honey, and others of native origin; Japan Persimmons (*Diospyros Kaki*) in eight varieties; Figs, Plums in variety, Japanese and native; Quinces, Blackberries, Strawberries in great quantities, Grapes of many American and hybrid varieties, Japan Medlars (*Eriobotrya*), now ripe; Pomegranates, Mulberries, and various kinds of nut trees, such as Pecans, Chestnuts, Walnuts, and Almonds. Sugar-cane, Corn (Maize), and Cotton are extensively planted, as well as Sorghum. This district possesses the best Peach land in the State, the growth of the trees being astonishing and the crops certain and large, not a failure in Peaches having occurred in five years. I have seen a Peach tree, the seed of

which was planted in March, 1886, 8 feet high and 1 inch thick at the surface of the ground, bearing fruit in thirteen months from the time of sowing the seed.

I have now in my possession a seedling Honey Peach. The seed was planted in February last, and the plant is now as large as the one mentioned above, and is bearing ten Peaches. A planter here set out in February, 1885, 200 Peach trees, one year budded, on one acre of land. In 1886 he sold enough fruit from them to pay for the trees and all other expenses connected with them up to that time. In 1887 the crop realised 202 dollars, or over £40 nett. This year the trees are full of fruit, and promise a larger crop than last season. There are in this district Peach trees twenty-five years old in good thrifty condition and bearing large crops every season. Oranges do well after attaining such a size as to shelter each other, the trouble being that the young tender growths of small trees are killed back nearly every winter by the occasional "cool snaps," sometimes reaching 2° of frost, but only lasting two to three nights when the wind is from the north-west.

A grove of 100 Orange trees, in which I am now living, last season (November and December) produced 80,000 Oranges, or an average of 800 per tree, the trees being from ten to fifteen years old. The next crop promises to be considerably lighter, judging from the small amount of bloom.

The Japan Persimmon and Kelsey's Japan Plum are being extensively propagated, and a large demand for the fruit is expected.

The Le Conte Pear is a strong, vigorous grower, and bears very heavy crops. Ten trees, seven years old from the cuttings, standing behind the hundred Orange trees already mentioned, produced last July a crop of 40 bushels of fine Pears, or 4 bushels per tree, and were sold in the town of Waldo at 1 dol. a bushel, but double the money could have been obtained had they been shipped to Northern markets. This is an excellent Pear for stewing, canning, and evaporating (drying), and large groves are being planted for these purposes, as a large demand is anticipated for both home and European consumption. Figs are mostly grown for table use in the houses of the planters, no great efforts having yet been made to grow them on a large scale for drying and shipping purposes.

The Peach is now the fruit grown in greatest quantity after the Orange. The varieties Peen Tau, and Honey Peach, of Chinese or Japanese origin, being most extensively grown for shipment; and as they are the earliest Peaches produced in the United States, good prices are of course obtained—the Peen Tau, being the Peach planted by the gentleman already referred to, who realized by them £40 an acre. Many kinds of native Peaches, both cling and freestones, are also grown, and ripen from July to September, being mostly used for canning and evaporating for home use, very few being shipped to Northern markets, as Peaches from New Jersey at that time of the year completely cut out Florida Peaches, which would not then sell for sufficient money to pay the carriage.

The Kelsey Plum, being a new importation from Japan, has not yet come into general fruiting, so that no reliable statement can yet be given as to its paying well, but great things are expected of it.

Several varieties of Plums of the improved Chick-asaw type are grown, and are of fairly good quality.

Blackberries grow in immense quantities all over the country, and are very fine. Any quantity can be had for the picking. Many acres of Strawberries, principally Numan's Seedling and the Hoffman, are grown in this country, hundreds of bushels having already been shipped, at remunerative prices, from an area of 10 miles round.

Grape Vines look very healthy, with five bunches of bloom. The fruit ripens at the end of May and in June, and is principally sold in local markets at from 5d. to 1s. 8d. per pound.

Sugar-cane grows well, and is usually made into syrup of very fine quality; no facilities were here for sugar-making until the last month; the first

sugar-mill in the State is now almost ready to commence work in South Florida.

The Japan Medlar or Loquat (*Eriobotrya*) is an uncertain cropper, in consequence of the plant blooming during winter, when the light frost often kills the blooms. This fruit cannot therefore be relied upon as a money-making crop in this district. Pomegranates grow like weeds and bear plentifully, but I have not yet heard of anyone planting them extensively, one or two plants only being usually found growing in the Orange and Peach groves. The same remarks apply to Mulberries, which bear fine crops; but there is little sale for the fruit in Florida.

Fruit culture has almost reached such proportions as to justify the erection of canning and evaporating factories, and some of the shrewdest landowners are planting Pears and Peaches, the Le Conte (Pear) and native freestone type (Peach) for these purposes, and good interest on their investments will be realised when their fruit trees come into bearing.

Vegetables.—Potatoes planted early in January are ripe in April, and are a profitable crop. The present crop, now being shipped, is selling in Philadelphia at from 8 to 9 dollars per barrel—32s. to 36s. Cabbages sown in September form heads in February and March. The following is a copy of a return made by a Philadelphia commission agent. The crates here mentioned are 2 feet long, 14 inches deep, and 14 inches wide, and are called barrel crates, they contain from forty to sixty Cabbages of medium sizes, or they will hold eighty small ones. The crates cost 12½ cents. each (about 6d.) :—

		Philadelphia, March 19, 1888.			
Sales by ———.		Dols. Cents.		Dols. Cents.	
On acc. of 8 crates of Cabbages at...	3	50	17	50	
Via Atlantic Coast Line—					
Freight	4	42		
Cartage	0	50		
Commission	1	75	6	67
Nett proceeds		10	83		

As these crates contained an average of forty Cabbages in each, the amount realised shows a profit of over 2½d. or 5 cents. per head. I have succeeded in growing good Cauliflowers (a small planting, as I was informed they would not succeed, the result, however, was very satisfactory to me and I intend to grow an acre in the autumn). Some of the native farmers here had never seen a Cauliflower until they saw mine growing.

Asparagus, Turnips (of the Early Flat Dutch and Purple-top White Globe varieties), Rutabagas, Beet, Tomatos, Squashes, Cucumbers, Musk Melons, Pumpkins, Radishes, Pepper (Bull Nose and Sweet Spanish), garden Peas, Onions, Okra, Lettuces, Egg-plants, Sweet Corn, Collards, Carrots, and Beans (French, Snap, Black Wax, Golden Wax, and other varieties), succeed well, and make good crops. Water Melons are very much grown in Florida, and Melons weighing 60 lb. are quite common in the Water Melon season, and some have been produced weighing 100 lb.

The climate is such as an Englishman in ordinary health would thoroughly enjoy, and do a good day's work every day in the year, except during July and August, the hottest months, when it is the rule to rise with the sun, work until 10 A.M., then rest until 3 P.M., and resume work until dusk. Many invalids have to thank the balmy climate of Florida for prolonging their lives, the great charm of this climate being the refreshing breezes blowing almost every day, a calm, still day being the exception.

From 2 to 10 miles away are lakes, where plenty of fish can be obtained, and in the neighbouring Pine woods and low-lying lands are quail, ducks, squirrels, herons, cranes, curlews, and many other birds; so that a profitable day's sport can be enjoyed without much exertion.

I have travelled extensively in Great Britain, and on the Western Continent from Northern New York to the Isthmus of Panama, and consider the climate of Florida to be the most enjoyable I have ever experienced.

Market gardening pays well in Florida, particularly in some seasons, when the Potato or Cabbage crop

falls below the average in the Northern States, and especially when the settler is careful in selecting for his home a district where competing lines run, so as to secure the advantage of reasonable freight rates. There is in addition another advantage an immigrant can enjoy if he be an industrious, pushing man. Many owners in Florida have purchased land and erected good houses for winter residences, coming down from the Northern States for four, five, or six months during the winter, and many pieces of land of from 5 to 20 acres can be taken charge of, and the land cultivated by the caretaker for his sole benefit, the owner retaining the fruit crops, of course, provided he keep all the land planted in Orange and Peach trees properly cultivated and free from weeds. No payment is made by the owner for such cultivation and care-taking, the man put in charge making all he can by planting a good crop of vegetables during the autumn, winter, and spring months. I have often thought how admirably this would suit some of the struggling market gardeners in England. Some I am acquainted with would make a very decent income, and keep the Orange and Peach groves in good order, and be thankful of the opportunity.

In conclusion I would say, I am no land-agent, have no land to sell either for myself or anyone else, but am so satisfied with my investment in Florida land, that I purpose spending the rest of my life in that balmy country. Box 147, Waldo, Alachua County, Florida, U.S.A.

SABAL PALMETTO.

THE engraving (fig. 89) represents a group of trees of the Cabbage Palmetto (*Sabal Palmetto*, Lodd., *Chamærops Palmetto*, Michx.), at Jupiter Inlet, Florida, from a photograph taken in 1886. The character of the trees is well shown in the engraving, and they are described as being found more or less abundantly in "North Carolina, south along the coast to Key Largo, Florida, extending along the Gulf coast to the Apalachicola River; very common, and reaching its greatest development upon the west coast of the Florida peninsula, south of Cedar Keys." In Porcher's *Resources of the Southern Fields and Forests* it is said that from "this noble and characteristic tree is derived the well-known armorial emblem on the escutcheon of the State of South Carolina. It has been carried in the fore front of battle by every regiment in the service of the State from Mexico to Manassas." The Palm is not only an ornamental one, but it is also very useful to the people where it grows; thus the Cabbage or heart is very extensively used as a vegetable, and the juice is said to make a good wine of a similar character to the well-known toddy prepared in India from the Palmyra Palm. The fruits are sweet, and constitute a nourishing food to the Indian and hunter. The young leaves are used for making hats, mats, baskets, &c., and are whitened by brushing them over with a solution of oxalic acid, or exposing them to the fumes of burning sulphur. The full grown leaves are used for thatching.

NEW OR NOTEWORTHY PLANTS.

CATTELEYA LABIATA,

MR. SCOTT'S VARIETY.

THIS comes very near to *Cattleya Nalderiana*. It has the same longish flower and markings on the petals. The markings are, however, far more numerous, and a modern orchidist might regard it as a crime to combine the two. The colour of the flower is like that of *Cattleya Nalderiana*; sepals light rose, bordered with dark purple; petals light rose, with oblique accumulated markings on the borders, and dark purple stripes in the middle, the median ones all running longitudinally. The lip has much of the ordinary character. This is decidedly a *rarissima avis*, and may make the amateur's heart beat. I had

it from Mr. F. Sander. It was grown by Mr. H. G. Cole, gardener to Mr. C. W. Scott, Woodbank, Dumfries, the lucky possessor. It is of Sanderian origin. *H. G. Rehb. f.*

LÆLIA PURPURATA (Lindl.) WHITEANA, n. var.

Mr. R. Brooman White, of Arddaroch, Garelochhead, Dumbartonshire, N.B., purchased some four years ago a freshly imported *Lælia purpurata* at Messrs. Stevens' rooms. It has since wonderfully developed, and bore fifteen blooms this year. The dark purple of the lip is much admired. I cannot fully share the enthusiasm, as I have Mr. Low's much darker variety for ever in my memory. The leading

with a brownish-purple central space, whitish-sulphur-coloured on the anterior sides, and rose on the median zone. The characteristic broken mauve-purple lines are not to be seen. I have to thank Mr. S. Courtauld, Bocking Place, Braintree, Essex, for this grand beauty. *H. G. Rehb. f.*

LÆLIA PURPURATA, Lindl., MR. BROOMAN WHITE'S VARIETY.

Take the finest inflorescence of *Lælia purpurata* Williamsi (Warner, Williams, and Moore, *Orchid Album*, i., pl. 9, 10), give it longer and narrower sepals (which scarcely show any strong indigitation of the purple nervation), imagine the base of the lip

DOUBLE HARDY WHITE FLOWERS.

DOUBLE white flowers are much in request; one of the reasons for this is owing to their great staying powers as compared with the more evanescent single whites. I subjoin notes of a few I grow for cutting, or dividing, for making wreaths or otherwise, and which will succeed in the smallest town or country garden.

The Double White Gardenia Daffodil—alba-plena odorata.—This is now preparing to expand its blooms, and I only place it first so that those who have it not

FIG. 89.—SABAL PALMETTO, LODD. (SEE P. 680.)

feature of this is that it has no yellow in the throat or on the lip, but a certain undecided light purple with darker veins. The point of the lip would appear to have been white, as in the var. *prætexta*. I propose to name it after a very ardent collector, who is in the happy moment of earning his first great orchidic reward. Happy state! *H. G. Rehb. f.*

CATTLEYA (LABIATA) MOSSIE, Hook., MR. S. COURTAULD'S VARIETY.

This is a wonderfully grand thing. The sepals are like those of *Cattleya Mossia*, Nalder's variety—rose, with dark purple margin. The fine petals have a nearly whitish central mid-area, and much darker radiating, partly confluent lines on the margins. The lip has its orange mid-zone rose-coloured above,

orange-yellow, in lieu of sulphur-coloured, and you have the beautiful variety which has just flowered with Mr. Brooman White, Arddaroch. A gorgeous inflorescence is at hand; it measures 9 inches across the petals, and the lip is 2½ inches wide. *H. G. Rehb. f.*

ASHES AND SALT ON POTATOS.—The *American Cultivator* says it is an excellent plan, as soon as Potatos are well up, to go over the piece and throw a handful of a mixture of salt and ashes on each hill. The preparation is soon washed down into the ground by rains. It repels insects, makes the Potatos fair and smooth, and helps to draw moisture to the Potato during a dry time.

can make a note to add it to their list. Being the double form of *N. poeticus*, and its variety *N. p. ornatus*, the brilliant crimson corona, in the latter instance, makes the blooms very effective. If the water is changed and the base of the stems clipped, they will last three weeks.

Matricaria inodora flore-pleno.—I prefer plants one or two years old, and planted in a fairly rich moist bed or corner of a border. Very old plants in a dry exposed position, give small blooms which are often semi-double.

The colour is pure, and the blooms are curiously lacinated or fimbriated, reminding one of the pompon *Chrysanthemum Marabout*, or *fimbriatum*. Cuttings readily strike from ripened pieces in autumn, or will root from side shoots pegged down

now. It is a persistent bloomer, and has beautiful deep green Chamomile-like foliage.

Spiraea filipendula fl.-pl.—Speaking of finely-cut Fern-like foliage brings me to the double Dropwort. Once planted there is little danger of losing it, as the fleshy roots bury themselves deeply in the soil, and are thus quite unaffected by drought, heat, or cold. I often wonder it is not oftener used as an edging plant, as the foliage rosettes when not in bloom, especially in winter, would be very effective, and being pinnate and prostrate, would be most useful. The compact corymbs, so like those of the Meadow-sweet, are a soft creamy-white, and are useful to the bouquetist. It can be divided at almost any season, and, cared for or not, it seldom refuses to bloom. Much rarer and somewhat more difficult to manage is *Spiraea palmata*. For contrast, grow them side by side.

Achillea ptarmica fl.-pl. (Double Sneezewort).—The blooms are smaller than those of the *Matricaria*, and somewhat resemble one of the perennial *Chrysanthemums*. Like the foregoing, it takes care of itself when once planted, and throws out white underground stems yearly. I gave it a corner of a border some years ago, and it has remained there since, with only an occasional top-dressing, and the subtraction of a piece occasionally for a friend. I certainly should not like to be without it. The double serrated form comes into bloom later, and is thus desirable also.

Double White Pyrethrum and *P. achilleaefolium*.—I have tried to form a collection of the best double *Pyrethrums* to be had from various nurserymen; but if I were restricted to one, that one variety should be *Mont Blanc*. Nurserymen have so many demands for these that they have frequently to divide their stock plants—which they can safely do at any time during the month of April—so that it is seldom that a large five years' clump, giving nearly as many hundred blooms, is seen, except in private gardens. Their lasting power, when cut, is almost proverbial. *Virginal* and *Via Lactea* may be added; the latter is a very old form, very hardy, and gives an enormous amount of flowers for cutting. I have a seedling form, a whitish-yellow, with curiously crimped guard petals. To these may be added the stately border perennials, *P. uliginosum* and *P. lacustre*, blooming in the autumn, and with flowers upwards of 3 inches across.

Chrysanthemum speciosum, *C. latifolium*, &c.—These two are, perhaps, the best of the *Marguerites*, and are, perhaps, more frequently seen in greenhouses than in borders. They form beautiful bushes, with the foliage hidden with flowers, and are readily propagated from cuttings. The summer and autumn-flowering *Chrysanthemums* are now becoming so generally utilised for bedding arrangements, and so useful for cutting, that other forms are comparatively dwarfed. At a distance, last autumn, I thought beds of *Madame Desgranges*, *Secur Melanie*, and *Le Petite Marie* were the most effective Mr. Grahame had at Hampton Court Palace Gardens—the height graduating in the order named.

Campanula persicifolia alba fl.-pl.—This is certainly a most useful and easily grown and propagated perennial. However, if too many side plant-growths are allowed, or if the soil be poor, the perfectly-shaped *Camellia*-like blooms are never attained, and it becomes weedy like the double blue form. I am inclined to think there are inferior strains; at all events, my variety is imbricated to the centre, and I seldom see it so elsewhere. It divides readily at any time, and blooms for a lengthened period. *C. latifolia* I do not care so much for; perhaps the next best single would be *C. platycodon* *alba*, not noticing at present the alpine forms, which are generally very dwarf, and not useful for cutting.

Ranunculus aconitifolius fl.-pl. (Fair Maid of France).—This is one of the hardiest of the *Ranunculi*, and once planted, the claw-like tubers are seldom lost. It propagates with me slowly, but grows vigorously—nearly 3 feet high—producing a profusion of handsome very double white blooms on long stalks. In borders it is well to label it, as

when the foliage dies down it may otherwise get lost.

Hesperis matronalis fl.-pl. (Double White Rocket).—This old favourite has been rescued from oblivion by the returning love for hardy flowers. The flesh-coloured strain, though more robust, is not so sweet or fragrant, and cannot compare in purity with this, which is not so easy either to retain or propagate; in fact, propagation by suckers, sparsely produced, is, I believe, the only method. Remembering the exigency of your space, I will merely add the name of another favourite, *Saxifraga granulata fl.-pl.* A special article would be required for *Carnations*, white *Pinks*, and many other beautiful and sweet flowers, that all admire and like to grow. *W. J. Murphy, Clonmel.*

BALCONY GARDENING.

A balcony garden well arranged may be made exceedingly ornamental. If the balcony is a large one, and an elaborate system of management be determined upon, fresh plants may be introduced suitable to each season of the year, and the old ones in that case must be removed to make room for their successors. But a good effect may be produced by a much more simple and less costly system—the same plants may, in fact, be retained during the whole year, as in the case of a very attractive balcony garden of which an illustration appeared in *Domestic Floriculture*—a work written some years since, by Mr. F. W. Burbidge. Outside the window in this case, on the floor of the balcony, which is sufficiently wide to afford standing room for a small tub or a large flower-pot, four well grown plants of *Yucca recurva* were planted in ornamental vases. The rest of the ornamentation was exceedingly simple, and yet most attractive, consisting of a drapery of Irish Ivy, which was planted in boxes of soil hidden by foliage, and resting on the floor of the balcony. This fast-growing creeper had been allowed to clamber over the balustrade, from which it hung down several feet, affording a neat apron for the handsome *Yuccas*; and the effect was so good that no change was required in either summer or winter, except in the former season, when a few pots of flowering plants were introduced among the evergreens. There are plenty of other hardy plants that might in such a place be substituted for the *Yuccas*, such as golden variegated *Euonymus*, *Thuia*s, *Box*, *Hollies*, and *Retinosporas*. *Japan Aucubas*, *Conifers*, and many other shrubs, might be pressed into the same service; but whatever hardy plants may be selected for the balcony boxes in winter, to remain all the year or otherwise, let them be good, big, well-grown plants, and those of solid aspect should be neighboured by others more graceful.

Another practical hint is that, if the Ivy is to remain all the year round, some wire should be fastened to the wall, like that on which Vines are trained in a viney, for the Ivy to take hold of, that it may be secure during strong wind. If it is intended to remove the boxes of Ivy in summer, the creeper must not be allowed to attach itself too pertinaciously to the wall, nor should the boxes of soil in which it is planted be too large, on account of the weight and the difficulty of removing them.

A large balcony with a window giving access to it forms a favourable site for more extended operations, and may be filled in succession with plants adapted to every season of the year. It may be fitted up with boxes, vases, flower-pots, hanging baskets, and even with a rockery, but the labour and attention necessary for keeping such an elaborate little garden in exquisite order must never be withheld. Frequent pruning and training will be necessary, and daily syringing in hot weather. In the dog days, which are dust-days in balcony gardens, watering should be done twice a-day overhead through a fine rose—once in the morning early, before the sun is strong, and again at night. In such gardens the house wall should be trellised and planted with suitable creepers, —Ivy, especially the handsome variegated sorts, *Wis-*

taria sinensis, or *Virginian creeper*. The former are, unfortunately, slow of growth, and should therefore be grown elsewhere and brought to the spot in their tubs or boxes, trained to their own supports. Veitch's *Ampelopsis* (*A. tricuspidata*) is perhaps the best town creeper, and it has in recent years widely invaded the domain of the old *Virginian creeper*, it being less coarse in habit. It forms a cheerful drapery for walls and balustrades in summer, changing in autumn into crimson and rich brown. These permanent creepers should be planted in the area below the balcony, when a little rich soil must be prepared for them, and manure added from time to time; or, failing accommodation below, they must be grown in tubs or other receptacles upon the balcony, and these must be well drained with broken crocks at bottom, and hidden with foliage. Other balcony climbers are various sorts of *Clematis*, *Honeysuckles*, *Jasmines*, *Cotoneaster micropbylla*, which has beautiful fine foliage and red berries. For climbing *Roses*, plant *Gloire de Dijon*, *Ayrshire Roses*, *Rose polyantha* and others, if they grow well in the locality. *Lophospermum scandens* and *Ecemocarpus scaber* may be added to this list. Annual trailing plants to be recommended are the pretty yellow *Tropaeolum peregrinum* and *Convolvulus*, with so many others, new and old, that we are tempted to refer readers on this point, and in regard to any creepers named here, but not known to them, to the nurserymen where they may be seen. *H. E.*

ORCHID NOTES AND GLEANINGS.

MR. TAUTZ'S ORCHIDS.

At Studley House Shepherd's Bush, F. G. Tautz, Esq., had a nice lot of Orchids in flower when we visited the collection recently. *Cypripediums* were of course the most noticeable feature, and there were several excellent rare plants in flower. Several new hybrids are going on well, and all around tiny seedlings in all stages of development may be noted. The seed is allowed to germinate in the moss in a pot in which another larger plant is growing, and sometimes the seedlings are to be seen growing on the roots of the other plants. One of the most attractive plants is a *Cypripedium Lawrenceanum atro-rubrum*, very vigorous and very richly coloured, especially on the dorsal sepal; and another is *C. selligerum majus*, which was bearing three flowers. *C. tomentosa* is pale cinnamon, with brown line markings on the lip, and a yellow staminode. A very grand plant is a hybrid between *C. Lowi* and *C. Hookeri*, called *popbrospitum*, with very fine colours, and plainly partaking of both parents; it has rather long stiff sepals, tipped with rose and spotted at the base with dark brown spots on a ground of brownish-green; the dorsal sepal short, with reflexed margins, delicate green in colour, with the nerves of a darker green; lip dull brown, almost like that of *C. Hookeri*, the male parent. There was a *majus* variety of *C. Hookeri* which is worthy of note, with short broad lateral sepals, greenish-brown, tipped with rosy-lilac, and margined with the same colour, spotted at the base with small brown spots; with a dorsal sepal, green fading to white at the margin; lip brown. *C. Cooksoni* (*C. barbatum* × *C. Lawrenceanum*) retains the dorsal sepal and lip of the latter, with the laterals of *barbatum* distinctly spotted—a pretty combination. *C. Dayanum superbum* is attractive on account of its foliage as well as of its fine flowers; the leaves are delicately—not heavily—variegated; the flowers are of great size, measuring about 6 inches in length; the long narrow acute dorsal sepal is white, closely veined with bright green; the petals being greenish-brown tinged with pale pink; the lip has a deep pouch with sharp lobes, and is a dead palish brown. *C. Argus* is not an uncommon species, but mention should be made of it on account of the fine colour of the flower; it is one of the liveliest coloured of the *Cypripediums*, the almost white sepal and petals displaying to advantage the red-brown and

green of the lip. *C. Hartwegii* is a good form; the dorsal sepal and also the basal one are of a transparent white marble, and netted with red-brown; the petals narrow, and rose-coloured; the lip is suddenly bent forward about the middle, and rests, as it were, in the pouch of the two basal sepals; it is yellow, with red-brown sides and shading. *C. Druryi* was represented by a good plant, and deserves a place in all collections, owing to the peculiarity of its colouring; it is yellowish throughout, with a broad deep purple-brown line down the centre of the petals and the dorsal sepal. *C. Mastersianum*, a new hybrid, was also in flower. This was described in the report of the Royal Horticultural Society's show at p. 471. It is a handsome flower, and distinct.

The above is only a selection. What might not be said of a collection of the 200 varieties and species of *Cypripedium* which are to be seen at Studley House! and in such fine health, too, that Mr. Cowley deserves full credit for the way in which he manages these, and, indeed, all the plants at Mr. Tautz's place. Other good and interesting plants were numerous, but only a few can now be named. There was a fine form of *Odontoglossum Harryanum* with three flowers, *Cattleya Schroderæ*, *Dendrobium Farmeri aureum*, golden colour all over; *D. Veitchianum*, an old species, but rarely seen, the flowers of which are greenish-yellow, with red-brown lines on the lip; *Lycaste gigantea*, brown and yellow, very strange; *Cattleya Lawrenceana concolor*, paler than the original form; also the rare *Schomburgkia tibicina*, with rose ground colour, brown tips to the segments, and brown markings; *Odontoglossums*, *Masdevallias*, *Cattleyas*, *Miltonia vexillaria*, in grand form, were also in fine condition.

One of the latest of Mr. Tautz's acquisitions is *Trichopilia crispa* var. *splendens*, well named; it is a rich dark port-wine colour throughout, slightly bronzed in places. In *T. crispa* the sepals and petals are pale brown, but in the plant under consideration they are of the fine intense colour just named. There is also *T. c. marginata*, lip rose with a white margin, the perianth segments brown and white.

CULTIVATION OF AERIDES.

In a state of Nature these plants luxuriate upon trees, mostly near the margins of or in the vicinity of streams; in such situations they receive, through their aerial roots, which grow to a great length, whatever moisture arises from evaporation, &c., from the heavy dews which envelope them; a portion of these roots hang free in the air, whilst others cling to the stems and branches of the trees, and in such positions they also enjoy the heavy rains that fall during their time of active growth, which is also their flowering season. *Aerides* grow nearly all the year round, but in a much less degree when the rainy season is over, as at this time they depend entirely upon the dew, and whatever moisture may arise from beneath to help to support them. They require a slight period of rest, but as they have no fleshy bulbs to maintain them during severe drought, Nature has provided for them in a choice of situations, whilst the shade obtained from the forest trees materially assists in keeping them in vigorous health, although in very few instances are they found wild in such fine condition as they are to be seen in our *Orchid*-houses. Under cultivation they thrive in a warm and moist house during the summer months. The temperature, however, must be reduced during the winter, and the foliage kept dry. They are fine objects, grown in baskets and suspended from the roof, in which position the roots derive the full benefit of the moisture with which the atmosphere should be charged; they, however, will thrive equally well in pots, living sphagnum moss being the best material for them, with good drainage, as they require frequent waterings during summer, whilst in winter the moss should be kept in a nice moist condition.

The leaves of *Aerides* should never be allowed to shrivel, as this causes the lower ones to turn yellow and fall away, leaving a naked unsightly stem;

neither should they be subjected to the full sun during the hottest part of the day, but a shading of very thin material will be found sufficient to break the sun's rays from them. "*Orchid Album*," April.

PERISTERIA ELATA.

This plant is easy to cultivate, but it requires a good season of growth, and after its bulbs are well matured in autumn, thorough rest is necessary; this may be maintained until it begins to show its flower-spikes, which occurs in the early spring months. During the period of active growth an ample supply of water to its roots is essential, in order to enable it to develop large bulbs, but after growth is completed it requires a very small quantity only—indeed, just sufficient to prevent it from shrivelling being all that is necessary. As it requires strong heat when growing, and coming as it does from the low-lying hot districts about Panama, the temperature of the East India-house is the best suited for it during the whole year. It also requires to be well exposed to sun and light, but the foliage must not be allowed to scorch, for such treatment is injurious to all plants, as it impedes their growth and renders them unsightly. The best compost for this plant is good rich turfy loam and leaf-mould, with a good supply of thoroughly decomposed manure mixed with it. The drainage must be good, with some fibrous peat above it, which will keep it in good working order. The pot should be filled to within an inch of the rim, and the bulbs placed on the top of the soil, first spreading out their roots and just covering them with a little of the compost; carefully water it for some time, and the roots will soon penetrate the soil, as they are produced freely. "*Orchid Album*," April.

LÆLIA ANCEPS SCOTTIANA.

This plant requires precisely the same treatment as the species; that is to say, it should be placed at the coldest end of the *Cattleya*-house, near the glass, shading it but very slightly, this being the great secret in the cultivation of these Mexican *Lælias*, as unless they are well exposed to sun and light they will neither produce robust bulbs nor flower freely. During its growing season an abundant supply of water is necessary to the well-being of this plant, and in warm weather, when it is making its young bulbs, it should be syringed twice daily (morning and afternoon) in order to induce it to root freely. It requires a high temperature during spring and summer; in its native country this plant, whilst making its growth, is subjected to strong heat and heavy rains, which keep the bulbs wet throughout the night, so that the greatest amount of moisture should be spread about in the afternoon, after the house is closed. When growth is finished just sufficient water to keep it from shrivelling will be ample, until the spikes attain the height of about 1 foot, when more water will be requisite to enable them to produce fine flowers. *Lælia anceps* and its varieties will thrive either in baskets or in pots; they should have good fibrous peat and living sphagnum moss to grow in, whilst the best time to repot them is just when they begin to grow and make new roots. "*Orchid Album*," April.

THE BULB GARDEN.

THE DOUBLE POET'S NARCISSUS.

Facts which throw a light upon the production of double flowers by the common wild Daffodil have given rise to much discussion during the last few years; and we also have had a good many loose and doubtful statements concerning the doubling of the Poet's Narcissus. It has been now and then asserted by the owners of certain gardens that *Narcissus poeticus* will not continue to produce single flowers there, and that after a few years they all turn double. In reply to this, Mr. Peter Barr assured us, four or five years ago, that the doubles of this species belong to one variety of it, and that this variety is the one described by the writers of the beginning of this

century as *N. patellaris*. When this statement was made by Mr. Barr, I for one disputed it. At that time I had double and single *Narcissus* growing abundantly and promiscuously in my garden, and they seemed to pass from one form to the other at their own caprice. But having made up my mind to investigate the matter I lost no time in doing so. By far the commonest form of single Poet's *Narcissus* in English gardens is that known as *N. recurvus*; figured and described in Sweet's *English Flower Garden* series ii., t. 188. I distributed several hundred bulbs of this form amongst various gardens which had claimed the power of producing double flowers of the species, and invited the owners to double the flowers of the bulbs sent. I also began carefully to watch specimens in my own garden, and to study the differences between the varieties known as *patellaris* and *recurvus*. The result is that after an investigation extending over four or five seasons I am convinced that Mr. Barr is right, and that all the double Poet's *Narcissus* belong to the variety *patellaris* unless some other double variety has been produced very recently.

There have long been in cultivation many varieties of Poet's *Narcissus*, and I know that within a few years the single variety most in favour, because of its earliness and its elegance of form, is one called *ornatus*. I am not going to speak of this or of any other variety except the two which have been for many years, perhaps for centuries, grown side by side in old gardens, one single, the other double—the single being *N. recurvus*, and the double *N. patellaris*. No double form of *N. recurvus* has ever, as far as I know, been produced; and though the single form of *N. patellaris* is grown sparingly, it seems to have so strong a disposition to become double in cultivation that, like the large double yellow Daffodil, the single form of it is hardly known. Curiously enough, however, *N. patellaris* is the wild *N. poeticus* of English botany. Other varieties may have been naturalised in England recently, but in all the old recorded habitats *N. patellaris* is the only known form. In some of these places single, semi-double, and double flowers are found mixed up in the same clumps, but when transferred to gardens the tendency of all these bulbs seems to be to produce double flowers.

The chief difference between the varieties *patellaris* and *recurvus* consists in the leaf. The latter, called in English the drooping-leaved *Narcissus* (Sweet's *English Flower Garden*, part ii., t. 188), has leaves which grow upright for two-thirds of their length, and then turn over at a sharp angle and droop; the leaves of *patellaris* have a spreading habit, and rarely droop. This distinction is obvious at first sight, but when the flowers of *patellaris* remain single they may easily be distinguished from those of *recurvus*. In the former the outline of the crown is more regular, the purple rim is bounded by an inner rim of white; the petals have less tendency to double up lengthways, the spathe is larger and longer, and the pedicel is generally bent at an acute angle, so that the flower is turned downwards. In the semi-double forms the white rim within the purple rim remains visible, but in the very double forms the divisions of the corona are often nearly suppressed; this suppression, however, is not constant, and varies with season and soil. H. Worth thought that the presence or absence of the purple edge in the double flower was an indication of a different origin, but I believe that this is not the case, and that the double *poeticus* which he describes has no existence as distinct from the double *patellaris*. It may seem curious that amongst so many varieties as are known to exist in the species *N. poeticus*, only one should produce double flowers, but I have done what I can to collect specimens and evidence, and I have never yet met with any other. *C. Wolley Dod, Edge Hall, Malpas.*

[In the less double forms some of the stamens within the cup become petaloid, while in the fully double varieties the cup is absent, the stamens increased in number, all petaloid, and the perianth segments also increased in number. Et.]

THE TULIP.

The Royal National Tulip Society have fixed June 9 as the date of the exhibition this year, but it would appear that the flower in the early districts will be over by that date—ours are now (May 26) in full flower in the open air without protection. There is an excellent prize list, and the committee ask for new subscribers and exhibitors, as the ranks of both, they say, "have been sadly thinned of late years by deaths." Our Tulips have all flowered very well this year, and the markings are, I think, better than usual; but after what I saw in Holland this year, we shall get larger flowers and better growth if the bulbs are planted almost as deep again as we have been accustomed to plant them. Considering that we do not give the bed any protection whatever, the cleanness of growth and stamless purity of the blooms are remarkable. Of course there has been no heavy rainfall to play havoc with them. *J. Douglas.*

THE POUCH OF THE CALCEOLARIA.

IT HAPPENED to have a plant of the yellow variety of *Calceolaria*, with maroon speckles, on my table; on it I found a so-called monstrous form of flower; it was all yellow, and both its segments were exactly alike, and both small—in fact, it resembled a miniature open money-purse. On each side, between the two equal segments, was a rudiment of a petal. On one side of the ovary were two distinct stamens, and on the opposite side the usual one stamen, with its filaments double the thickness of each of the other two. It appeared to be made up of a connate pair; the sepals were four, one of their divisions being bifid. This monstrous flower appears to represent an ancestral form, in which two opposite petals were suppressed, and the remaining two of equal size and form. The stamens in the cultivated form with enlarged pouch are two, and would appear to represent two connate pairs.

What can be the object of one of the petals having become developed into a pouch, which was afterwards taken up by horticulturists and increased by selection to its present enormous size, so much so that the flower is nearly all pouch? In the bud the pouch is small, and is doubled over the smaller upper petal so as to completely protect the organs of reproduction from inclemencies of weather, &c., and this may have been originally the purpose this enlarged petal subserved. Then when the flower became ripe for expansion, the pouch-form petal dropped downwards to escape the stamens and stigma, which lie under the edge of the small hood-like upper petal. This pouch would then, perhaps, form a convenient landing-place for insects.

Now, the question naturally arises, had insects anything to do with the development of this form of flower, beyond, perhaps, carrying pollen from one plant to another?—that is, not in the sense of modifying progressively its form, but in the sense of perpetuating a particular form which had arisen independently of insect agency. The interior of the pouch shows no trace of nectar organs. I thought perhaps the interior of the hood might secrete this material as an attraction to insects; but there also I could discover no trace of nectar. The stigma only slightly projects beyond the anthers, and the pollen is so close to it, that self-fertilisation would be quite possible even if the wind only shook the flower, or by small insects, such as aphides, creeping over the stamens and pistils; and it is interesting to note that, when the flower is ripe and fully expanded, the corolla, with its stamens, drops off bodily with the greatest ease, and in so doing the expanded anthers, which previously embraced the pistil, brush by the stigma, and can scarcely help dusting it with pollen, more especially during sunshine, and if shaken off by the wind.

There can, however, be hardly any doubt, from experiments made by many, that cross-fertilisation gives a more vigorous progeny, and therefore it is not improbable that pollen may have been carried

from flower to flower independently of nectar-searching insects.

From the examination of the monster flower before mentioned, one might perhaps form some idea of the past history of the *Calceolaria* flower, back to a certain stage, thus:—At some particular period it would appear to have consisted of four sepals, four petals, four stamens, and probably also four carpels. Then two opposite petals became suppressed, and the two remaining ones assumed a pouch-like and symmetrical form, the four stamens becoming two connate pairs, and the four carpels also connate pairs, as they are probably at present. Later on, one of the pouch-like petals, being the outer one in the bud, developed more than the other, and acted as a protecting envelope, its pouch becoming also larger. Horticulturists then took up some specimens in which the pouch was still further exaggerated, and by selection made the enormous pouch of the modern *Calceolaria*, which is the main feature of the flower.

I may here note that in the plants under observation the leaves, which are in pairs and opposite, are mostly of unequal size, and not exactly symmetrical. Therefore the inequality of the two remaining petals may not impossibly be a feature partially inherited from the leaves. This, however, would require verification from a large number of plants. *E. Donavia, M.D.*

OLD AND NEW PASTURE.

THE annual report of the proceedings of the Sussex Association for the Improvement of Agriculture, which is doing a good national work, has just been published and issued by Professor Jamieson, F.I.C., chemist of the Association.

EFFECTS OF DROUGHT.

The year 1887 was of a very exceptional character, and has earned the title of "the year of drought," in a retrospect of not less than twenty-three years. How much the country, and also the individual, suffers by a bad season is well brought out by the experimental grass-plots of the Association; and the average character of season 1886, followed closely by the exceptional character of 1887, provides a good opportunity of showing what a season of drought represents on new and old pasture.

The following table contrasts the crops of hay of 1886 with those of 1887, taking the average of seventeen differently manured plots per acre:—

New Pasture.		Old Pasture.	
1886.	1887.	1886.	1887.
Average season.	Very dry season.	Average season.	Very dry season.
Cwt.	Cwt.	Cwt.	Cwt.
58	35	59	33

Thus it appears that the drought caused a decrease in crop of 39 per cent. on the new pasture, and of 43 per cent. on the old pasture.

EFFECT OF LIME ON OLD AND NEW PASTURE.

The quantity of lime applied in the experiments was 2 tons per acre, and the results obtained on the whole showed from the averages that the general effect, both on the old and the new pasture, was first to increase the produce of hay, and then to act in the opposite direction. Professor Jamieson says, it might have been expected that the first effect of so strong a substance as lime would be rather to hurt the crops, and that better results would be experienced later on. But it is the reverse action that has happened, and the following explanation is suggested:—That in the first year the plants are cleaned, as it were—freed, that is to say—from parasitic influences, both vegetable and animal, and hence the grass is enabled to grow more vigorously for a time. As the lime descends, however, till it touches the more tender rootlets of the grass, it may act on the soft cellular tissue of these tender root-fibrils, and exert

on them either the hardening or decomposing action which lime is known to have.

The report goes on to deal with the questions of ploughing up old pasture; the relative effect of different manures on new and on old pasture; and the effects of draining pasture-land, with other treatments of seeding and sheep-grazing.

ARAUCARIA CUNNINGHAMI
GLAUCA.

THE "Moreton Bay Pine," in its green form, is one of the handsomest of trees for conservatory decoration, but beautiful as it is, it is surpassed in this particular by the glaucous variety. A fine specimen of this variety may be seen growing in the Temperate-house at Kew, where it recently produced its cones, which were exhibited recently at one of the meetings of the Royal Horticultural Society, and from one of which the accompanying illustration (fig. 90) has, with the permission of the Director, been engraved. The cone is a pigmy compared to that of *A. imbricata*, *A. Bidwillii*, and others; and it so much resembles a Teazel in general appearance, that we were not surprised to overhear some visitors so calling it—a circumstance which seems to indicate the desirability of conspicuous labels. The tree forms vast forests along the Brisbane River, individual trees growing to the height of 100—130 feet; hence it is very valuable as a timber tree. What follows we cite from Messrs. Veitch's *Manual*. The trunk is "generally divested of branches to the greater part of its height, and with the foliage clustered at the extremities of the branches. The leaves on the sterile branches are needle-like, obscurely 4-angled, straight, rigid, and sharply pointed; on the fertile branches they are shorter, stouter, and closely appressed. The young plants cultivated in England have a pyramidal habit less formal than that of the other *Araucarias*; the upper branches are ascending, those below horizontal, and the foliage bright green."

FLORISTS' FLOWERS.

AURICULAS.

WITH the bloom in pots, as well as out-of-doors, the season has been long-continued; even now (May 25) we have a few blooms of the late-flowering alpinas in the rock garden. I write at this time to urge the importance of attending to the plants during the months of June and July. We report about half the number of our collection in May or early in June, and the other half when the seeds have been saved in July or August. Auriculas will not bear neglect at any time, and will soon show by their appearance whether they are objects of interest to their owner or not; but in this respect they are not different from any other class of flowers or fruits. It is the attentive careful cultivator who loves his plants who is successful. They will not now occupy much of the time of the cultivator, but the little attention they do require must be given at the right time. After re-potting, the plants must not be exposed to drying winds, but be covered with the glass lights, well tilted at the back and shaded when the sun shines upon them. It is better to place the frames on the north side of a wall, or fence, to protect them from the sun during the hottest part of the day. They should now be making their summer growth, and a check from want of water or scorching sunshine would be injurious.

Small seedling plants, the produce of seeds sown in the spring, should be grown on steadily without any check, and as they increase in size must be potted on into larger sizes, as they require more space for development; they will flower in large 60's. Amateurs and others who attempt the work of seedling raising must not expect to raise first-class varieties without the exercise of much patience, the green-edged class being perhaps the most difficult of all in which to expect improved forms. In

each case it is best to save seeds from the very best forms in each class, and the plants selected as seed-bearers should have good constitutions. The edged varieties of Auriculas will also in many cases produce selfs. I may say, without exaggeration, that there have been hundreds of selfs amongst the seedlings I have raised, but none of them have been worth growing again. The only way to get good selfs is to raise seedlings from the best selfs by cross breeding, and it will be found by experience that it is as difficult to get an improved self as it is to improve on the grey and white-edged forms.

Whether one may be successful or not, there is always much pleasure in anticipation; and experience to be of any value must be obtained by following up the practical details of the work, carefully watching and noting the results. I find the alpine Auriculas succeed quite as well planted out-of-doors here as they do in pots, and very beautiful they are, especially when planted in the rock garden, and they stand well under hot sunshine—much better, in fact, than the common Primrose does. I tried two clumps of them, a dozen plants or so in each; they

this the vigour of the plants and the size of the blooms will be increased, although it must not be forgotten that increased size does not always mean good form, large size and coarseness sometimes going together.

Seedlings out-of-doors are very strong, and look as if we might expect a better display than usual, their marked vigour being accounted for by the plants being put out as early as July, so that they had ample time to establish themselves before winter began. Named varieties or seedlings, propagated in the usual way about the first week in August, were planted out early in October, but they have made but little growth since, and are now starting into flower, which will be of poor quality, because the plants were not established sufficiently early. These plants will make a better display next year if they are allowed to remain where they are. They are now planted in deeply-trenched and well-manured soil, and when layered will form a mass of plants a foot or more in diameter. In October thin out all the layers except about five round each stool: let these remain to form the basis of the plant next

start into growth, go on with vigour, and without any after check. Amongst thousands of plants I do not see a blank space. It would seem that the best time to plant all tubers and bulbs is just before they start into growth, for if they remain in the ground for any length of time before growth commences, and the soil is very cold and full of moisture, decay will sometimes take place, and some may get crippled, if not killed outright. This is the natural inference to be drawn from the results obtained with both the French and Scotch strains of the Ranunculus. The Anemones are also making excellent growth this year, but they were planted with the Tulips in November, about the end of that month. *J. Douglas, Great Geories.*

THE BULB GARDENS OF HAARLEM.

(Continued from p. 622.)

Messrs. C. G. VAN TUBERGEN, JUN., SWANENBURG.—This firm cultivate large quantities of Hayacinths, Tulips, Narcissi, and other bulbs; but in addition to this they have been, during the last few years, engaged in collecting choice hardy, bulbous, and other plants, and are now the possessors of a very choice collection. They have three nurseries in different districts, but that at Swannenburg is set apart for, and seems specially adapted to, the growing of Lilies, and many other hardy bulbs.

Closely made hurdles are employed to protect the plants from winds and spring frosts; two parallel rows of these, about 6 feet high, are set up so as to enclose two beds of about 4 feet in width, with a narrow alley between them. The ends are also enclosed with hurdles, except that a space is left in the middle as an entrance, and over which is hung a mat. The hurdles are kept upright by means of stout posts, and to render them more durable they are dressed with a coarse kind of varnish. The top is left open to the weather, but it is very easy to throw some shading over it if it be necessary. The Lilliums of course were not in flower, but many of them had started, and some had made considerable growth. *L. Thunbergianum* was very plentiful, and as there is now great variety in this species a large well grown bed of it will be very attractive. *L. Hansonii* was the most forward, the spikes promising to be very strong, although the wind was high and the weather cold. The leaves of this Lily are of a beautiful light green, and not in the least injured—the stems had grown to a height of 30 inches. A fine lot of *L. cordifolium* planted out in frames was growing very vigorously. Is this different from *L. giganteum*? I notice that Messrs. Barr in their catalogue group the two varieties together as *L. cordifolium giganteum*. The *Botanical Magazine* describes them as distinct species. *L. cordifolium* is figured at t. 6337, and is from a specimen grown in the open air at Kew. Native of Japan. Dr. Wallich's Indian *giganteum* is figured and described at t. 4673, from specimens grown in Messrs. Cunningham's nursery at Comely Bank, Edinburgh. As *L. cordifolium* had been known to botanists for more than 150 years, it would claim precedence. The best lot of *Tecophilaea* I saw in Holland, was in this nursery, and in three varieties, viz., *T. cyanocroceus*, *T. violacea*, and *T. Leichtlinii*, all very beautiful and quite distinct from each other,—they were also planted out in frames, where they seem to do very well.

In the beds protected by hurdles, amongst other hardy plants in flower, the rarer species of *Muscari* were conspicuous; *M. azureum ligulatum*, deep blue, had been in flower since January. *M. commutatum*, a dwarf plant, with pretty spikes of dark blue flowers; *M. Heldreichii*, distinct and pretty blue flowers, with a white mouth; *M. flavum*, long bells of pure yellow; *M. paradoxum*, a very distinct plant, with broad leaves, and long spikes of rich blue flowers. *M. Szovitsianum* was very pretty, and nicely in flower, the plant dwarf, with blue flowers. I noticed in flower a small *Muscari*-like plant, under the name of *Bellevalia leucophlœa*.

FIG. 90.—CONE OF *ARAUCARIA CUNNINGHAMII* GLAUCA (MORETON BAY PINE). (SEE P. 684.)

were near each other, in the same soil, except that one clump was more shaded than the other by the projecting rocks, and those exposed to the sun have flowered best and grown stronger than the others. Neither of them suffered for want of water during the summer months.

THE CARNATION AND PICOTEE.

The appearance of our plants shows that they are just two weeks later than usual; but if fine weather continue we may expect the plants to make up for lost time. We are busy placing sticks to the stems, now rapidly rising, and while this work goes on a pepper-box filled with tobacco powder is at the hands of the workman to dust any plants with on which greenfly are observed. Insect pests seem to be spreading very rapidly in the garden, the continued east wind having checked vegetation, but it has not the same effect on the increase of insects. The plants should always stand in a position out-of-doors well exposed to the sun, the colour then seems to develop even before the flower-buds burst. Now is a good time to surface-dress the plants if this be thought necessary, by placing on the surface some stimulating manures mixed with loam; by doing

year. All that is required is to cover the space between the plants with some rich top-dressing. Such plants are well established before the winter, as they are not severed from the parent plant, are seldom injured by the most inclement winter weather, and they make a grand display at flowering time. Seedlings are now growing away nicely, having been pricked out from the seed-pots into boxes. We are thus careful with them, as seeds are not easily obtained, and the plants are much safer in boxes; the seeds also germinate more freely in pots, if these be placed in frames over a little bottom-heat. These seedlings are planted out in the Ranunculus and Tulip beds, when the roots of these plants have been lifted.

THE RANUNCULUS.

I have been very successful with my beds of these plants during the last few years, and they are again looking first-rate. I can only attribute this to late planting. In each of my successful years they have been planted quite a month or more later than the old growers recommended, or than I planted them myself at one period. The time was the end of March, and the tubers seemed then to

There is also a very good collection of species of Tulips, and one of the most handsome is *T. Kaufmanniana*; it has immensely large flowers, as grown here, of a creamy colour, with a deep yellow centre, and in some cases a ring of Roman red was formed above the yellow; *T. lanata*, brilliant red and black centre, was just opening, the petals being spread out flat. *T. Kaufmanniana* has been raised from seed, and is a variable species; *T. Greigi* has not been raised from seeds, although good seeds are freely produced.

Fritillarias of various species were mostly in flower, and were very interesting; *F. inodora* is a dark-flowered, handsome form of the Crown Imperial, neither its leaf nor flowers having any scent; *F. bucharica* forms nice plants a foot high, furnished with racemes of pretty white flowers; *F. tulipifolia* is a pretty, not uncommon species; *F. Thunbergii*, white, was cultivated mostly in pots plunged in the soil, it succeeding best in that way. I also observed (w) very lovely, yellow species growing very freely; *F. pudica* was nicely in flower, the plants 3 or 4 inches high, and flowers of a rich deep yellow, and fragrant; *F. armena* is a taller plant, the flowers also of pure golden-yellow colour, but the true *F. armena* has dark purple flowers. There is a yellow form, which I believe, was first found by Mr. Maw near Smyrna; both forms are figured in the *Botanical Magazine*, t. 6365.

The species of *Erythronium* were very complete. These are very beautiful garden plants in the early spring. I like the yellow-flowered *E. americanum*, which, although it has been growing freely on our rock garden for many years, I have not seen a flower on it, and here, in the rich, deep, sandy soil, it produced a mass of flowers. It is not a new plant in England, and was grown and flowered by Messrs. Loddiges early in the century. The finest thing in the collection was a mass of *E. sibiricum*, whose large purplish flowers with white centres were fully 3 inches across; *E. Nuttallianum*, clear yellow; the well known *E. giganteum* or *E. grandiflorum* was very handsome, with as many as five of its large handsome creamy-white, yellow-centred flowers.

Alliums are not universally esteemed, but they are favoured by Messrs. Tubergen; the species mostly grown are Siberian and Central Asian introductions, and are hardy enough. I noted *A. karataviense* as having broad handsome leaves, with a margin of red; it was coming into flower, and the large heads of rosy-white flowers would be very pretty. *A. Rosenbachianum* is a giant amongst them. It produces broad leaves, and the flower-heads are supported on stems 4 feet high.

Amaryllis Hallii is a new hardy species with rose-coloured flowers slightly pencilled with blue. It flowers like the *Belladonna Lily*—in autumn—when the leaves have died down. There is a fine collection of species of the *Crocus*, and also of hardy *Orchids*. *Goodyera pubescens* looked beautiful in leaf, after being exposed all the winter.

Trilliums seemed to delight in the sandy soil, or else in the shelter and shade of the aforesaid hurdles; *T. sessile album* had larger white flowers than I have seen on the old purple type form; *T. discolor atratum*, variety with maroon-coloured flowers, is an improvement on the old type with small greenish-yellow flowers; *T. atro-purpureum* is reddish-purple; *T. grandiflorum majus* is the best of the species, and its masses of white flowers were very beautiful.

Colchicums were represented by the old and rather interesting *C. crociflorum*. The flowers are white with bluish stripes. The pretty, little *C. luteum* was passing out of bloom.

A mass of the orchidaceous plant, *Calypso borealis*, was interesting and pretty. It has one solitary cordate, entire, slightly obtuse leaf lying on the ground, and the rose [purple] coloured flower is borne on a scape 3 inches high.

The early flowering *Irids* are charming plants for the spring garden, and grow most freely here. Foremost amongst them were the forms of *I. reticulata*, the Snake's-head *Iris*, *I. tuberosa*, a free flowerer, is a contrast to it, with its lurid green and black flowers.

The Scorpion *Iris*, *I. alata*, had flowered in frames; its lilac-blue flowers are very pretty. *I. arenaria* is a dwarf rock plant, producing its greenish-yellow flowers in May; *I. caucasica* has primrose-yellow coloured flowers, and *I. orchoides* is a very distinct species, producing its yellow-coloured flowers from the axils of the leaves.

There are very large beds of *Ixias*, and I am told that some of the new varieties have very large flowers; but they have all suffered considerably this year from frost.

Anemone fulgens made a fine display. The variety *Aldboroughensis* has the largest, best formed flowers. *Lachenalias* are grown in cold frames, but they have not done so well this year, owing to the long-continued frosts. Quantities of interesting plants that flower in the winter and early spring are grown in pots, and plunged over the rims in these cold frames. The winter-flowering *Iris*, *Tecophilæa*, hardy *Orchids*, &c., show off their beauties to advantage under this method of culture.

Amongst other flowering plants *Corydalis Kolpakowakiana* was very pretty, with its finely cut leaves and numerous spikes of pale pink flowers; this is another Central Asian plant recently introduced.

THE GLASS-HOUSES.

The few heated houses were well filled with choice plants, *Orchids*, &c., and amongst them I noticed a very pretty winter-flowering *Begonia* named *Gloire de Sceaux*, which, I was informed, is a perpetual bloomer. I was also greatly pleased to see flowering very freely a very pretty plant I have failed to flower myself, viz., *Tropæolum azureum*. It has been flowered quite recently at Kew under the care of Mr. Watson. The tubers are potted in August, and the pots are plunged in a cold frame for about three months. During winter the plant is grown in a warm greenhouse. In the same house with it *T. brachyceras* was in flower; add to these varieties, *T. tricolor*, with its scarlet, green, and black flowers, and we have three excellent climbing plants which should have an honoured place in every garden. The above remarks will show how full of interesting plants some of these little-known bulb gardens are. *J. D.*

EXHIBITION OF TULIPS AT HAARLEM.

Since the spring of 1885 there has been annually opened in May, at the nurseries of E. H. Krelage & Son, Kleinen Houtweg, Haarlem, Holland, a splendid show of late Tulips. This season four large beds of such Tulips have been planted, which probably will be in bloom at the beginning of this month. When in flower the beds are covered by two spacious tents, covering an area of about 7000 square feet.

This show has never before been surpassed in Holland, and is probably unique. Amateurs in general, and of Tulips especially, should pay a visit to the show, which will be worth even coming over from England to see. In the nursery grounds at the Kleinen Houtweg is found a large collection of the best varieties of all the different classes of late Tulips, and amongst these are excellent one-coloured breeders of Flemish origin, called *baguettes* by the French. This collection, doubtless, is unrivalled for variety and for brilliancy of colour. Here are represented all colours possible, from pale porcelain to the darkest violet, from soft rose to the most brilliant red, from light brown to the darkest black, which exist in the vegetable kingdom. These Tulips have very large well formed flowers, which are placed on fine strong stems. If once these sorts could be multiplied so as to be sold in quantity they would form an unrivalled addition to our list of spring bedding plants and give to our gardens an attractive feature at a moment when striking colours are so much wanted. Moreover, when these sorts "break" there may be expected from them a lot of first-rate Tulips. The black and the darkest red shaded in this collection are really remarkable, and are likely to prove of great horticultural value. *E. H. K.* [A number of these *baguettes* are before us, and very fine flowers they are for the purpose indicated. *En.*]

MELON HOUSE AT SEFTON LODGE.

[SEE SUPPLEMENTARY SHEET.]

The Melon-house represented in our Supplement is, says Mr. James Taylor, the gardener at Sefton, 40 feet by 9 feet, and runs from north-east to south-west. It is a span-roof structure, with a pit on either side about 2 feet in depth and 3 feet wide, which, before planting the Melons out, is filled with stable-manure, a small ridge of soil and manure being then placed on the surface, and when the temperature has fallen to 95° the plants are put in, taking great care that the collar of the plant is well raised, so that the loss of the plants by decay at that point is averted as much as possible. The system I usually adopt with my early crop is to place them 18 inches apart in a row, and when they have attained a length of 3 feet, the points of the leaders are nipped out, and the laterals which push from the main stem are allowed sufficiently to develop, and to fill the trellis without crowding. For the mid-season and late supply the plants are placed 2½ feet apart, and the fruit is allowed to form on the lateral shoots after these have been once pinched, by this means restricting the growth, and preventing the crowding that would occur were the fruits formed far from the main stem. I consider a crop of three or four fruits sufficient for each plant, the fruit then ripening whilst the plant is in full vigour. Each Melon weighs usually from 5 lb. to 8 lb. The leaves are remarkable for size, texture, and firmness, and as a rule no trace of red-spider is to be seen. The plants are kept well syringed with tepid water; and the kinds I find answer best are *La Favourite*, *William Tillery*, and *Eastnor Castle*; the latter is a good one for early forcing, as it sets so freely.

Melon growing is carried on in this district under somewhat unfavourable circumstances, loam not being obtainable, the light chalky soil of the parings from the roadsides having to be employed in place of it. Notwithstanding, I manage to gather excellent crops of fine fruit, as may be seen from the view presented.

PLANTS AND THEIR CULTURE.

IMPATIENS.—Besides the ordinary garden Balsam, several other members of this genus are largely grown during the summer months, none being better than *I. Sultani*, and the white-flowered *I. flaccida alba*. They are both of extremely simple culture, a light, rich soil, without shade, and a temperature of about 60°, suiting them well; but after the plants have attained to a medium size they may be placed in a lower temperature, where, without making much new growth, they will continue flowering for a long time. A good plan of getting up a stock of these plants quickly, is to put several cuttings in a small pot, place them in a moderately close moist pit or frame, when, with ordinary attention to shading and watering, they will be nicely rooted in about ten days; in a few days more they will have filled the pots with roots when they should be at once potted, using the soil before recommended, and pots of the size that is deemed most useful. The plants are of free branching habit, and seldom require any pinching of the shoots, nor are they subject to insects, if allowed a light airy position, with an occasional syringing whilst growing. *I. Hawkerii* is a beautiful plant of recent introduction, with large red and carmine coloured flowers; it is a somewhat stronger grower than either *Sultani* or *flaccida alba*, and small single plants look the best. *I. Jerdonia* is a similar plant, but having yellowish-white and red flowers—it is a very pretty species, but does better in a trifle more heat; the same may be said of *I. Hookeriana*, which flowers during the autumn and winter months. But to do this plant properly, it should be well grown during summer; and as the autumn approaches, a light position with a temperature of about 65° answers best. If kept in a low temperature, the flower-buds are apt to drop. All the varieties mentioned are easily kept over the winter as cuttings.

Hardwood New Holland Plants.—*Eriostemons*, *Pultenæa*, *Oxylobium*, *Grevilleæ*, *Tremandras*, *Leschenaultias*, *Gastrolobium*, *Dillwynias*, *Darwinias*, *Aotus gracillima*, and other Australian subjects, should be attended to as they go out of flower, by being slightly cut back, or otherwise trimmed into shape, repotting those which require it, using good fibrous lumpy peat, with plenty of

silver-sand in it. A few pieces of white sandstone is also beneficial. After being repotted, and while they are making their growth, a somewhat closer and moister atmosphere should be afforded them; and remembering that the amount of flower next year will depend on the growth made. Although advising a closer treatment, this does not mean anything approaching to those conditions as applied to stove or soft-wooded plants, and if such were maintained, even if the plants escaped the ravages of mildew, probably the growths would be so soft that good flowering would be an impossibility. These plants above all things must have plenty of light and air, and the less shading is used the better for the plants. And as regards moisture in the air of the house, the foliage of the plants should be allowed to get dry for a considerable portion of the twenty-four hours. It is on bright afternoons, and, as the season advances in early morning, that syringing of these plants is best done; there is then time for the foliage to dry before nightfall. A chink of air should be left on at the top ventilators during the night. To keep the plants quite clean seldom anything is required beyond thorough syringing during the summer months. This should be done daily, and in the case of large plants with the hose or garden engine. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

SUB-TROPICAL BEDDING.—Generally speaking, there are few private gardens where this is carried out on a large scale, owing, probably to the erroneous belief that it is costly, and that unusual skill is required to attain good results, which is certainly not the case. There are now so many plants in gardens well adapted for the purpose of sub-tropical bedding, and which may be raised from seed annually, that its cost needs not enter into the question, but it will be found more a matter of climate than anything else. All beds and borders for these plants should be well drained, and placed in the most sheltered spots the garden will afford. In planting single beds avoid overcrowding, or planting too many species in one bed merely for the sake of variety—both are faults which should be guarded against. Pleasing and effective beds may be obtained by planting a single species only, carpeting the surface with some dwarf-growing subject, such as *Alternanthera* or *Mesembryanthemum*, with an edging of *Lobelia* or *Pyrethrum*. Do not plant out any of these tender species before the middle of the month, and harden them off gradually for this purpose.

Roses.—Examine these plants for insects, and take means to eradicate such forthwith. Those growing against south walls are at this season very liable to be infested with aphids, and it will be found a good plan to syringe them late in the evening with weak tobacco-water in the proportion of 1 pint of concentrated tobacco-juice to 4 gallons of soft water. Keep a sharp look-out also for the Rose maggot, or much damage may be done in a very short space of time; the young larvæ may easily be detected by the web they spin in the young leaves; crushing these curled leaves between the finger and thumb will kill the maggot. Pinch off not needed wood buds on H.P.'s, and leaving only one to a shoot if large flowers are wanted for special purposes. It will also be advantageous to mulch old beds with farmyard manure, and water afterwards if the weather should be dry.

Hardy Annuals.—These should be thinned out at once wherever necessary, leaving from three to six plants to a square foot, according as the plants grow small or large; the lesser number will be ample for such plants as *Candytuft*, *Clarkia*, *Collinsia*, *Bartonia aurea*, &c., i.e., when they are large enough and safe from the attacks of slugs. When overcrowded, plants and flowers do not become so large as they would otherwise, and the flowering season is usually of short duration. Earth-up lightly, and put sticks to sweet Peas.

Lilium auratum.—For flowering in open beds and borders imported bulbs that were started in pots in frames a few weeks ago should now be planted out, and as soon as sufficiently high they should be tied to make them secure.

Double-flowered *Pyrethrums.*—If not already done these ought to be staked and tied without further delay. Wherever they are much grown for cutting purposes special attention should be given to them at this time of the year; and old-established beds will be greatly benefitted by being watered with weak liquid-manure, the labour that this entails being

well repaid by the larger blooms. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PINES.—During this month, generally more fruits will turn in than are required at a given time, and if some of the plants on which the fruits are now half coloured be removed, pots and all, to ainery from which the Grapes are being cut, their ripening will be much retarded; the colour of the fruit will be improved, while the flavour will be considerably better than if allowed to remain in the moist atmosphere necessary at this season of the year for the proper swelling up of the fruits. Prior to the removal of the plants all the suckers which are sufficiently large should be detached from the plants and potted for stock. The house or pit in which plants are ripening should receive a larger amount of air than it would be judicious to afford to plants swelling their fruits, and less moisture in the atmosphere than heretofore recommended; although the plants must not be allowed to become so dry at the root as was recommended last month, else premature ripening will result. The soil at the roots must be kept moist, but not wet.

Successions.—The second batch of plants, which were recommended to be started to throw up at the end of March or beginning of April in the calendar for February, will now be swelling rapidly; these will require liberal supplies of weak manure in the water every time water is afforded, and let each plant be examined twice a week, and if it be dry let a thorough watering be given. It not unfrequently happens that the plunging material at the bottom of the bed where hot-water pipes are used gets very dry from long-continued firing, and becomes congenial to the roots of the plants, which are mainly at the bottom of the pots. I have frequently in such instances watered the beds with water at a temperature of 85°; afterwards, when the thermometer reached 80° in the morning with sun-heat, admitting a little air, and increasing the amount until the glass stood at 85°, at which it may be kept till shutting up time. Damp the surface of the beds and paths the first thing in the morning; at mid-day the paths should be sprinkled, and at shutting-up time the plants should receive a gentle dewing overhead, and all available surfaces be liberally damped with a watering-can and rose. In syringing, avoid as much as possible the lodgment of water in the crowns. The temperature may be allowed to run up to 95° for a time after theinery is closed, and 75° maintained as a night temperature; when the nights are mild and warm a little air should be left on the top ventilators after 6 P.M., allowing them to remain so during the night.

The younger succession plants should be kept 5° lower than fruiters. A slight shade during the hottest part of the day should be afforded to all plants in active growth; keep the plan steadily moist at the root, and supply ample atmospheric moisture, and on the paths only, damping down, &c., as recommended above for older plants. See that the heating apparatus is comparatively cool by the time the sun attains any power over the temperature, or more air will have to be afforded, which would lead to loss of moisture. The treatment of suckers is similar to that for growing stock—only a little more bottom-heat should be given to induce the plants to root freely. See that young stock are not allowed to become dry at the root. When the sucker pots get fairly filled with roots it is better to pot the plants on than run the risk of a check, with the result that they would start prematurely and be worthless. *W. M. Bullie, Luton Hoe.*

THE HARDY FRUIT GARDEN.

CHERRIES.—The bloom in most districts of the country being now set on Morello, Kentish, May Duke, and other early varieties, the trees should have a thorough syringing. Examine the trees for black aphids, and if it be detected on them syringe the affected parts with tobacco-water or some approved insecticide. If the borders on examination should prove to be dry a thorough watering should be afforded them, putting on a slight mulching soon afterwards. The foliage of the May Duke Cherries is apt at this time of the year to turn very yellow, and when such is the case, a very simple remedy is to sprinkle the surface of the soil round about the roots,

and to some distance from the stem with fresh soot, which should be pricked in and the soil sufficiently watered to carry the soot downwards. One application is usually sufficient to bring the foliage back to a healthy green, but a second application will do no harm, should it be deemed necessary.

Trees growing on walls should have the leading shoots nailed in, and all young wood not required for laying in must be pinched to form fruiting spurs; cordon trained trees should likewise have their young shoots pinched back, leaving untouched the leading shoots if the trees have not reached their full limits. The branches of Morello Cherry trees, grown on the pyramid and lush forms, very often die off in a mysterious manner just about the period of the fruit stoning; to obviate this I find it is a good plan to pinch all young growths at the fifth or sixth leaf. Since adopting this practice we have lost but few branches compared with our losses in previous years when we left them unpinched.

Gooseberry Caterpillar.—This pest has appeared on the bushes in spite of every precaution, but so far the attack is fortunately confined to a few bushes only. Various remedies are recommended for destroying them, Hellebore powder being one of the number; but as that is a poison, it is not a safe one to employ. Here we are using dry wood-ashes on some of the trees, and tobacco-ash on others, the trees being thoroughly damped with the syringe before the ashes are applied. Tobacco-ash is apparently the better of the two, for as soon as it touches the caterpillars they loosen their hold of the leaves and branches and fall to the ground, when, upon being dusted over again, they curl up and die. The tobacco-ash must not be confounded with tobacco dust as sold for insecticide purposes. This was sent me to experiment with, to test its value as a manure, and it occurred to me that it might be useful for destroying caterpillars on Gooseberry trees, and so far it is certainly the best remedy that I have had experience with. All protecting material in the shape of canvas, Frigo Domo, &c., being now no longer wanted on the trees, should be dried and stored away. *A. Ward, Stoke Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

TOMATOES.—These should now have plenty of air and be gradually hardened off in readiness for planting out, when it may be safely done. If they have been managed in accordance with previous directions the pots will be full of roots, and the plants showing flower, and careful attention must be afforded them until planted out, not letting them get starved from want of water. In the southern parts of the kingdom they succeed well if planted in the open quarters of the garden and trained to stakes or hurdles, but in cold parts a warm wall is necessary to ripen their fruit properly. It is usual when planting them to dig in a quantity of rotten manure immediately under the roots, and in warm places this is a good plan, but if the garden be cool and moist the manure so employed is apt to encourage very strong growth, which is not favourable to fruitfulness, and it is therefore best to plant in poor soil and assist them with liquid manure when the fruit is formed; the main shoots should be trained 18 inches apart, and growth encouraged as much as possible but pinching off most of the lateral shoots as soon as they appear.

Thinning young Crops.—This operation is best done in showery weather, if possible, the plants being more easily drawn out at that time, and those remaining get quickly re-established, but the advantage of early thinning cannot be too strongly urged. A striking instance of its benefits occurred near this place last summer—in a field of Carrots, one third of which was thinned as soon as possible and gave a good crop of fair-sized roots, and the remaining portion was thinned eighteen days later, when the weather was much warmer, and the result was that scarcely any good roots were obtained from this portion of the field, although in other respects it was treated just like the other portion. Carrots should be left about 6 inches apart in the rows, Parsnips 9 inches, and Onions 4 inches, where only moderately-sized roots are required, but if large roots are wanted they should be left at double those distances.

Seeds.—Sow more French Beans, Scarlet Runners, Broad Beans, Marrowfat Peas, White Cos Lettuce, and Spinach, and if young Radishes are in request throughout the season a quantity of seed should be sown every week, choosing a cool and moist position, and the beds should be well supplied with water in dry weather. *W. H. Diers, Kilton Hall, Somerset.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

THE GARDENERS' CHRONICLE
who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, JUNE 6 { Evening Promenade and Floral Fête in Aid of Gardeners' Orphan Fund, in Flower Market, Covent Garden, 9 to 12 P.M. Linnean Society.

SHOWS.

WEDNESDAY, JUNE 6 { Reading. Ancient Society of York Florists. Bath and West of England, at Monmouth (five days).

SALES.

TUESDAY, JUNE 5 { First Portion of the Collection of Orchids formed by Dr. Duke, of The Glen, Lewisham, at Protheroe & Morris' Rooms.

WEDNESDAY, JUNE 6 { A Further Portion of the Collection of Orchids, formed by the late John Day, Esq., of Tottenham, at Stevens' Rooms.

THURSDAY, JUNE 7 { Importation of Orchids, from Mr. F. Sander, at Stevens' Rooms.

FRIDAY, JUNE 8 { Imported Orchids, at Protheroe & Morris' Rooms.

The Linnean Society.

This Society, which celebrated its first centenary last week, as we briefly recorded at the time, has not had the chequered existence which is so marked a feature in many such institutions; it has had its ups and downs, no doubt, but on the whole its progress has been uniformly prosperous. No sooner was the burden of debt removed than its progress became more marked, so that now, in addition to the possession of a splendid library of natural history, which is annually increasing, it can afford to spend £1400 a-year in the publication and illustration of scientific memoirs. The history of the Society may soon be told. On the death of the great Swedish naturalist his widow determined to sell her husband's books and collections. At the instigation of Sir JOSEPH BANKS, Sir JAMES EDWARD SMITH purchased the whole in 1784, and four years later established the Linnean Society. The story that a Swedish man-of-war gave chase to the English ship that was carrying off the treasures, with a view to retain them for Sweden, turns out to be a myth. The Linnean Society thus established numbered among its first members GOODENOUGH, afterwards Bishop of Carlisle; MAUSHAM, the entomologist; DRYANDER, a pupil of LINNÆUS; SWAINSON, BECKWITH, and JAMES DICKSON, a seedsman and herbalist of Covent Garden; so that thus early an association with horticulture was established which has never been broken, as most of the eminent horticulturists have been and are Fellows of the Linnean.

On the death of SMITH the Linnean collections were purchased by the Society from his executors, and for the purpose of meeting this expenditure a subscription was raised, and the remainder defrayed by the issue of bonds, which constituted a heavy charge on the resources of the Society for many years and crippled its development. Happily this debt has long since been wiped off.

Originally the proceedings of the Society were staid and formal to a degree, not to say conservative. Sir JAMES SMITH naturally considered the Linnean system as preferable to the natural system, although, as was well remarked at the Centenary, LINNÆUS full well knew that his artificial system was only a means to an end, the end being the establishment of a philosophical or truly natural arrangement, and of which he gave a sketch, but towards the elaboration of which he was only able to arrange the materials. We cannot here even sketch the history of the Society; but we cannot refrain from alluding to one of its Presidents, ROBERT BROWN. Sir JOSEPH HOOKER'S eulogy of the great botanist will shortly be made public, in the meantime the career of BROWN may serve as a useful reminder to those one-sided naturalists who, from necessity or choice, are specially addicted to one branch only of their science, that the broadest views are not gained, and the highest eminence not attained by lop-sided procedure. Sometimes we find botanists given up to counting stamens and pistils, like SMITH and some of his contemporaries. In modern times we find botanists ignoring the discrimination of species and their classification as things beneath their notice, and devoting all their attention to protoplasm and the minute structure of the plant. ROBERT BROWN was much too great a man to act thus. A study of his works reveals the profound investigator in each and every department of the science, so far as the means and material resources then at his command permitted. BROWN was as cautious as he was sagacious; his manner was not agreeable, so that when the genial and courteous Professor BELL succeeded to the Presidential chair, the Fellows experienced something of a sense of relief, and the meetings, if no less decorous, were certainly not so dull. Evening dress was no longer required of the Fellows, or even the President, but had fallen gradually into disuse, like the wigs of former times. Discussion and criticism of the papers read, instead of being tabooed, were welcomed, to the great enlightenment of the meetings, and the considerable advance of science. After BELL came BENTHAM, than whom none ever had the interests of the Society more at heart, or worked more indefatigably for it. The series of addresses he gave in his capacity of President rank among the most important publications in philosophical natural history. It was during his Presidency in 1858 that the paper which was the forerunner of the *Origin of Species*, by CHARLES DARWIN, was read, at the same time that a memoir on the same subject, and containing almost identically similar conclusions, was read from ALFRED WALLACE.

BENTHAM himself was converted to the new faith slowly, LYELL and HOOKER were not more hasty in their reception of the new views; but, surely if slowly, the descent of species from pre-existing forms, and their gradual modification became the acknowledged truth from which few if any now dissent, and perhaps none of the generation of naturalists that has grown up since 1858. In what precise lines the descent has occurred, and what have been the prime causes of the modifications everywhere witnessed, are matters still more or less in dispute. By a succession of elaborate papers containing the results of actual observation and experiment, DARWIN effectually silenced those who looked upon him as a mere visionary theorist. Since that time the Linnean Society, though by no means officially bound to support or diffuse this, that, or the other view, but only pledged to the search after and the promulgation of the truth,

so far as it is possible to arrive at it, has been a powerful means in disseminating and diffusing the vast body of new facts that have been brought to light as a direct consequence of the Darwinian theory. These have in a quarter of a century revolutionised natural history, and given to it an impulse which rivals in extent and far surpasses in variety that produced by LINNÆUS himself. The Darwinian views, indeed, are the proper sequel and complement to those of LINNÆUS.

The addresses delivered at this memorable centenary will shortly be published, so that we need not now allude further to them; but in drawing these brief notes to a conclusion we cannot help noting that the connection between botany and medicine was once as close as that between botany and horticulture. It has been deemed wise and proper to separate the two former. May the example of LINNÆUS, of ROBERT BROWN, the two HOOKERS, of BENTHAM and of DARWIN—all of whom markedly availed themselves of the resources of horticulture, ever suffice to keep firm the ties of reciprocal utility which ties botany and horticulture together in a common bond.

ROYAL HORTICULTURAL SOCIETY.—An Honorary Fellowship has been accorded by the Royal Horticultural Society to Mr. JOHN NEWTON, Gardener at the Inner Temple, London, in recognition of the services rendered by him on the occasion of the recent show in the Temple Gardens.

COMING SHOWS.—The next four shows will be of much interest to horticulturists, and we believe that special efforts are being made by the Society to obtain a larger number of exhibitors. On June 12 is a show of Rhododendrons, hardy Azaleas, flowering shrubs, Ranunculus, Anemones, Iris; on June 26, one of Begonias, Gloxinias, Pelargoniums, cut Clematises, Pæonies, Roses, Pinks; on July 10, one of Roses, Lilies, Strawberries; and on July 24, the Carnation and Picotee Show, and zonal Pelargoniums will be shown.

GARDENERS' ORPHAN FUND.—In aid of the funds of the above movement it is intended to hold a floral fête and promenade in the wholesale flower market, kindly lent for the occasion by his Grace the Duke of BEDFORD, K.G., on the evening of Wednesday, June 6 next, between the hours of 9 and 12 P.M. Her Royal Highness the Duchess of TECK has graciously given her permission for her name to be announced as a patroness of the fête. The wholesale flower market, the entrance to which is in Wellington Street, will present, with the immense quantity of flowers arranged by the growers, an unique and beautiful sight, unapproached by anything of the kind in the world, great meet of praise being due to the growers themselves for their promised assistance in staging their goods earlier than usual on this evening. The gratifying success attending the movement reported from time to time in these columns enables the first election of candidates (six) to be held on Friday, July 13 next, at the Cannon Street Hotel. A meeting of the committee was held at the "Caledonian" Hotel, Adelphi, W.C., on the 25th ult., Mr. GEORGE DEAL presiding, there being as usual a good attendance of members. The minutes of the previous meeting having been duly signed, a letter was read from the widow of the late Mr. JOHN WOODBRIDGE, from the first an active member of the committee, in reply to a vote of condolence and sympathy sent to her on his decease. The Hon. Secretary, Mr. A. F. BARRON reported that a balance of £772 16s. 5d. was at the bank, and it was unanimously resolved that a further amount of £500 of stock in Consols be purchased, making a sum of £1000 so invested. The Secretary also reported that the total sum promised up to date as donations was £1195 8s., of which sum £1093 5s. had been paid; and of subscriptions, £398 12s., £244 2s. having

THE PHOTO. STAMFORD, 8, 13, 27, MARTIN LANE, LONDON, S.W.

MELON HOUSE, SEPTON LODGE, NEWMARKET.

been received. Those who have promised subscriptions need to be reminded that the first election of children to the Fund takes place on July 13, and that no one will be entitled to vote whose subscription remains unpaid. During the past month the names of twenty-two new subscribers have been received; donations amounting to £26 13s., and subscriptions, 11s. Mr. J. SMITH, Mentmore Gardens, handed in the sum of £7, the proceeds of a concert given at Mentmore on behalf of the Fund. The sum of £7 16s. was announced from Mr. W. HOWARD, Southgate, collected by him at the Temple Show. Heartly votes of thanks were passed to Messrs. SMITH and HOWARD. The sub-committee appointed to prepare the voting paper presented the same, which was unanimsly approved. A letter was read from C. H. T. PRICE, Esq., Kenley, Surrey, on behalf of ALBERT EDWARD WEST, the son of his late gardener, and the youngest of a family of four children, informing the committee that since the nomination of A. E. WEST his widowed mother had died, and that the child was destitute. The Secretary announced that a list of subscribers to date had been prepared, and any person desirous of having a copy for election purposes should apply to him. A circular of invitation to the dinner on the day of election was read and approved; the same to be forwarded to subscribers with the voting paper.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We have pleasure in calling the attention of our readers to the fact that the forty-fifth anniversary festival will take place on Wednesday, July 4, upon which occasion the Right Hon. JOSEPH CHAMBERLAIN, M.P., has kindly consented to preside. It is hoped that the amount of subscriptions obtained will enable the Institution to grant pensions to the fifteen unsuccessful candidates of 1887, and also to add some others to the list of its pensioners.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER.—Mr. BRUCE FINLAY, Secretary of the above Society, informs us that the annual horticultural exhibition at Manchester has again proved a great success, about 50,000 persons visiting the show during the week, and the increase this year from 2 guinea and 1 guinea subscribers amounts to £2750.

"REICHENBACHIA."—With the present number the first volume of this sumptuous publication is brought to a conclusion. A review of the volume as a whole does but enhance our admiration of the artistic beauty and fidelity to Nature of these plates, while the interests of the botanist are served by Professor REICHENBACH's text, and those of cultivators by the judgment and experience of Messrs. SANDER. The following are the species figured in the last number:—

Odontoglossum crispum var. *Kinlesideanum*, t. 45.—In this curious variety the side petals are irregularly striped and flamed with red, and present a similarity in appearance to the lip, which is, however, less striped. The variety occurred in an importation of *O. crispum* made by Messrs. SANDER. It is a pelorioid form, which possibly may be of hybrid origin.

Cattleya Trianae Schroderiana, t. 46.—Sepals narrow, petals very broad, body white flushed with rose, lip with an orange throat and a broad anterior magenta blotch.

Epidendrum vitellinum, t. 47.—The large-flowered type of this beautiful orange-colored variety comes from Mexico—the smaller-flowered form from Guatemala. It may be termed an alpine Orchid, seeing that its home is on cloud-capped mountains amidst continual mists, hence, says Mr. SANDER, it must be treated strictly as a cool-house Orchid. Messrs. SANDER, moreover, always find that in moist localities, such as the West of England and Scotland, *E. vitellinum* is grown to perfection with the least trouble. It flowers in June.

Laelia anceps var. *Stellu* and var. *Barkeriana*, t. 48.—On this plate are shown the oldest and one

of the newest varieties of this species, as well as the darkest and the lightest flowered.

"FLORE FORESTIERE DE LA COCHIN CHINE."—M. PIERRE's magnificent publication on the forest flora of Cochin China has progressed as far as the 160th plate. It is a work in folio, with lithographic illustrations of the species and a French text. The arrangements of the stamens in the Garcinias, as here shown, is very interesting, while the economic value of the trees is great. A final plate is given of *Anamirta cocculus* which furnishes the seed known as *Cocculus indicus*. M. PIERRE repeats the tradition (quite false we believe) that the berries of this plant are used in the manufacture of beer in England. Fine plates are also given of the Tea shrub, *Thea chinensis*, Sims, and of some of its varieties. M. PIERRE makes five varieties—*Bohea*, *viridis*, *pubescens*, *cantonensis*, and *assamica*. Of the hybrid variety, M. PIERRE has no personal knowledge. As is the case with plants generally, certain varieties of Tea are suited to special soils, localities, and conditions. *Thea sasanqua* and *T. bongkongensis* are also figured. *T. Dormoyana* and *T. Piquetiana* are recommended for cultivation as ornamental plants. The number concludes with some illustrations of the fine genus *Elaeocarpus*, which is well represented in Cochin China.

ADONIS VERNALIS.—Mr. WARE sends us a curiosity in the shape of a dense tuft of green leaves, which he says—and we believe him implicitly—is, or was, a flower of *Adonis vernalis*. Here is what he says about it:—

"I herewith send you a something, I do not know what. It is a peculiar double form of *Adonis vernalis* which was a fortnight ago a beautiful golden-yellow, with a green centre; the green centre has continued to grow, and the yellow petals have been dropping at the same ratio as the green has grown in the centre: there are just a few left at the back of the flower for you to see. I have several plants of it all in the same way."

The centre of the flower is occupied by the pistils; in the ordinary course of things these pistils in the *Adonis* are very numerous, and arranged spirally along the sides of that part of the plant that runs through the centre of the flower, and to which its several parts are attached. These pistils, again, are, it is universally admitted, modifications of leaves. What has happened, then, in this case is that the pistils have developed in the form of leaves, and that the flower-stem has lengthened and produced numerous additional leaves instead of ceasing to grow, as it usually does. What has started this second growth we do not know, but it is easy to guess that a little water at a particular stage of growth with a little more sun-heat may have set the plant growing again, when under ordinary circumstances it should be devoting itself to the ripening of the seed.

TWIN-FLOWERED HYACINTH.—In turning over the pages of that interesting old volume, the *Hortus Floridus* of CUSPIN PASSE (1614), and which formed the subject of so much commentary in these columns last year, we came across, on t. II of the first part, a figure and description of a Hyacinth in which the two bracts at the base of the flower-stalk were enlarged, and of a leafy character, as happens in SNAYLOCK's variety of *Galanthus*. From the axil of one of these bracts, and in some instances from that of both, proceeded a flower-stalk. At the same place is mentioned a Hyacinth which produces flowers at first of a green colour, but which subsequently become blue, and finally white, while from the centre proceeds a second imperfect flower (median proliferation).

VICTORIAN FRUIT FOR THE ENGLISH MARKET.—The *Mildura Irrigationist*, April 18, says:—"Mr. J. LANG, the well known Harcourt fruit-grower, has succeeded in placing Victorian fruit on the London market with very satisfactory results. At the present time the Victorian market price for the class of Apples exported is about 6s. per case; but as they

are varieties which will keep well, Mr. LANG, had he not been exporting, would not sell them for about three months, when from 8s. to 9s. per case could be obtained. The cost of transit from the orchard to the steamer is 11s. per ton, and the freight from Melbourne to the consignees £4 10s. per ton, or twenty-eight cases, which occupy 40 cubic feet in the cooling chamber provided in the steamers. The total cost from orchard to the seller in London is, therefore, a fraction over 3s. 7d. per case, or 1 3/4d. per pound. This figure is applicable when there are no agents or intermediate charges; but the average cost is somewhat higher in relation to the consignments of Mr. B. G. BERRY. As this is the first year that Mr. LANG has exported any considerable quantity of fruit, he is not in a position to state what profits will be realised in connection with the retail trade. He is perfectly satisfied, however, with the inducements offered by the London merchants. The prices obtained in the London market during the past two years for sound Australian-grown fruit have been:—For Apples, from 2d. to 6d. each; and for Pears, from 2d. to 1s. 6d. each; or from £1 5s. to £1 10s. for the former, and an average of from £1 10s. to £2 per case for the latter fruit, which leave an excellent margin of profit."

M. H. CORREVON.—In acknowledgment of his eminent services in raising and cultivating rare species of the plants of Switzerland, this Genevan botanist has been named Corresponding Member of the horticultural societies of Antwerp and of Tuscany.

MR. B. S. WILLIAMS' NURSERY.—The Orchids at this nursery are now in beautiful flower, and we hope next week to give an account in detail of what there is of chief interest amongst them.

BEDFORD AND BEDFORDSHIRE HORTICULTURAL SOCIETY.—The fifth annual show of this Society will be held at Bedford on July 11, when special prizes of considerable amount will be awarded in open competition for plants, Roses, and cut flowers.

LATE FLOWERING FRUIT TREES.—A valued correspondent, who has kept a record for several years, informs us that his observations do not corroborate the generally accepted idea that late flowering varieties are more certain bearers than medium or early flowering varieties. "As a rule, very late flowering varieties of, say, Apples or Pears, are not of a robust habit; nor are they, taken one year with another, of an extra prolific nature. Few, or none, produce first-rate fruit, that is, having fruit of a large size, handsome in shape, first-rate in flavour, and of a high quality. Very early flowering varieties are not quite so indifferent. Medium (early or late as the case may be) varieties comprise, generally, all our best and most prolific varieties. Neither are varieties of Apples raised in colder or warmer climates proved to be equally productive and profitable with those of undoubted British origin. I am not," says our correspondent, "aware of a single type of Apple introduced from abroad, but what we have a better one of the same type raised in Britain. This remarkable fact first came under my notice when examining the Apples exhibited at the Congress at Chiswick, in 1883, and at Edinburgh, in 1885; and afterwards, more strongly, when reading the 'Reports' of both. Of course, these remarks about the superiority of home raised varieties of Apples do not apply to Pears, Plums, and Cherries, &c., although of all of them some of the leading varieties are British. I have the Report for 1887, of the American Pomological Society, before me, in which is a very interesting account of an experiment which has been made in the States, and the Dominion of Canada, by introducing a large number of the best varieties of Russian fruits—Apples, Pears, Plums, and Cherries—and the result is by no means encouraging. Between 400 and 500 varieties of Apples, about seventy of Pears, and many varieties of Plums and

Cherries, have been introduced from Russia to the United States, and so far as several years' experience goes, there does not appear to be much, if any, improvement among that host of varieties over those that were previously cultivated in the States. Still, the experiment is so far satisfactory, that it will set the question at rest—at least, for a time, in North America. I see and read most of the pomological 'Reports' and other literature, from every quarter of the world, especially that bearing on fruit that is hardy in this country, and it does not appear that fruit cultivation in the open air is any more certain, on an average of seasons, elsewhere than it is in Britain. Growers grumble at low prices and bad climate, or weather, &c., all the world over; but skill and energy succeed, under ordinary circumstances, in spite of it all."

NEW CAMELLIAS.—In Europe the Camellia has lost its place as a front rank plant, so rapidly does fashion change; but in Japan and China—the home of the plant—some extraordinary novelties are said to have been raised in recent years. Mention is made of a half-double variety of a deep purple shade which approaches almost to black, but which is rarely to be met with; another is a very double white flower with an almost golden suffusion; of this there are very few in commerce. The third novelty is of the form and colour of *C. alba fimbriata*, with flowers more than 7 inches in diameter; the fourth is a white flower with bands and stripes of another colour—a very interesting object, but which is rarely seen in perfect beauty. This variety has the property of bearing shoots which produce "sporting" flowers of orange-red, and sometimes pink. Besides these there are varieties of *C. sasanqua* in commerce—a white and a rose coloured. The flowers are double, and of the Anemone-flowered type. Both varieties flower in October. *Hamburger Garten und Blumen Zeitung*.

"FERTILITY MANURE."—We have tested this cleanly, not unpleasant smelling chemical manure, on plants in pots—viz., Cliveas, Dutch bulbs, Cytissus, Pelargoniums, &c.—and in the open border, with equally good results. It is found better to apply it as a weak solution, that has been well stirred and then allowed to stand (twenty-four hours) until the water has become quite clear before using it. Employed in this way its distribution is more regularly performed, and there is no risk of injury to the foliage and stems of the plants which it is desired to benefit. The growth of foliage is not unduly developed, but an intenser shade of green is brought out by its use.

AN UNCOMMON ARRANGEMENT OF PLANTS.

—In the *Garten und Blumen Zeitung* for May is an article descriptive of the Royal George Garden, at Hanover. Attention is drawn to a tasteful arrangement of plants of *Begonia rex* variety and *Rhodanthe Manglesii* in a group which has met with general approval, and under suitable conditions can be recommended. The rosy-yellow heads of bloom on slender tall stalks of the *Rhodanthe* are very effective when seen against the shield-like deep green leaves of the former. The plants are presumably growing in pots. In another part of this garden the groups of deciduous shrubs are rendered gay after their flowering season is over by sinking pots of various plants into the soil amongst the bushes, such as *Callistemon lanceolatus*, *Hedychium Gardnerianum*, *Metrosideros lophantha*, and *Erythrina Crista-Galli*.

FLOWERS IN SEASON.—Mr. T. S. WARE sends us a quantity of large-flowered hybrids of the common Cornflower 3 inches across the disc, and with stout tall flower-stalks. The colours vary from rose-pink, purple, and blue to white. He likewise sends a number of terrestrial Orchids, viz., *Ophrys myodes*, the only British representative of the genus; *O. lutea*, *O. scolopax*, white and brown; *O. Bertolini*, and *O. speculum*, being South European. *O. myodes* has

a chocolate-brown lip and green petals and sepals, and is an insignificant flower. *Orchis fusca*, British, was a nice spike of rosy-lilac and brown flowers; *O. undulatifolia* and *O. provincialis*, the former with pink, and the latter with pale yellow flowers, are natives of the South of Europe. *Cypripedium calceolus*, yellow and brown, and *C. macranthum*, red-purple, complete the list of Orchids. Mr. WARE states that these terrestrial forms grow very well in loamy or marly soil, the more tender species being benefited by a little shelter in early spring. Other flowers sent were *Brodiaea Howelli*, white and blue campanulate flowers in umbels; and the lovely dark blue flowered *Ixiolirion brachyanthum*, the former from California, the latter Thibetan, and which differs from *I. tartaricum* by its shorter bulbs, earlier flowering, and deeper colour. We have also received a plant of *Silene pusilla* from Messrs. J. BACKHOUSE & SOX, York. In our issue for July 9 last year, p. 44, an illustration of this extremely pretty plant is given. The flowers are very freely produced on short stalks, and are pure satiny-white, and the plant is hardy; it makes a welcome addition to rockeries, being very dwarf, attaining only about 1½ inch.

SIR ROBERT LODER, BART.—The death is announced of Sir R. LODER, Bart., rather suddenly, at Beach House, Worthing. The deceased Baronet was the only surviving son of GILES LODER, Esq., of Wilsford House, Salisbury, and he is succeeded in the baronetcy by his eldest son, Mr. EDMUND LODER, who is High Sheriff of Northamptonshire, and a member of the Council of the Royal Horticultural Society.

MARKET GARDENING NEAR PENZANCE.—The *Cornish Telegraph* of Thursday, May 30, contained the following interesting particulars:—On Monday, between 1 and 2 cwt. of Grapes were cut by Mr. THOMAS, of Ridgovean, Gulval, near Penzance, for the London and other markets. Mr. THOMAS had also no less than twenty-eight large glass-houses for growing Tomatos. Last year Mr. THOMAS cut and disposed of no less than 8 tons of Grapes from his vineries, and some of the fruit realised as much as 8s. per pound. At Panion Mr. R. THOMAS is busily engaged in Cucumber growing having fourteen long houses stocked with plants. The Potato crop is rather backward for the time of the year, but appearances indicate a remunerative yield on the whole.

A BOTANICAL JOURNAL.—An illustration of the change which has come over the study of botanical science in this country of late years is afforded by the appearance of the first part of a new journal entitled *Annals of Botany*. This is edited by Professor BALFOUR, of Oxford; Dr. VINES, of Cambridge; and Professor FARLOW, of Harvard, Mass. Systematic botany pure and simple is to find no place in these *Annals*, if we may judge from the contents of the first part. Physiological botany in its morphological aspect seems likely to be well represented, and Professor WARD's paper on the "Histology and Physiology of the Fruits and Seeds of *Rhamnus*" will remind readers of a former generation of DECAISNE's monograph on *Madder*—no slight compliment to Professor WARD.

CULTIVATION OF FRUIT TREES.—The *Indian Agriculturist* states that the Quetta authorities are on a fair road to make that promising place one of the best cantonments in India. They have now turned their attention to the cultivation of fruit trees; and the Ranikhet and Simla nurseries have recently supplied a large number of English fruit trees.

PUBLICATIONS RECEIVED.—*The Principles of Agricultural Practice*. By J. WRIGHTSON, M.R.A.C., F.C.S., &c. (London: CHAPMAN & HALL, Limited, 11, Henrietta Street, Covent Garden, W.C.).—*The Co-operative Wholesale Societies, Limited, Annual for 1888*. (Manchester: Balloon Street.)

HORTICULTURE AT THE GLASGOW EXHIBITION.

This exhibition is unquestionably a great one, and excels that of Edinburgh in most respects. The grounds in which it is held form part of the beautiful West End Park of Glasgow, which were already well and skilfully furnished, and required very little in the way of planting for embellishment, which the local nurserymen have not availed themselves of as far as they might have done. Messrs. Austin & McAslan, Glasgow; Messrs. Methven & Sons, Edinburgh; and Messrs. Little & Ballantyne, Carlisle, have the most important exhibits of trees and shrubs. The collection of the first-named firm comprises a fine selection of Rhododendrons, Hollies, standards and bushes, Conifers, Sweet Bays, &c., grouped with excellent taste on a large square grass plot in front of the greenhouse set up for exhibition by Messrs. McKenzie & Moncur. This group will shortly form an attractive feature in the grounds, as Rhododendron plants bristling with flower-buds form a very considerable proportion of the material composing it. The two last-named firms exhibit their contributions on the borders respectively to the right and left of the main entrance to the buildings. Both have obviously studied the requirements of the position they occupy from the decorative point of view, rather than the well-known riches of their respective nurseries. The borders being close to the foot of the walls, they have each attempted, and successfully, too, to tone down the plainness of the extended lines of the latter by planting noble specimens of pyramidal Hollies, Conifers, Aucubas, Rhododendrons, &c. Messrs. Roger McClelland & Co., Newry, Ireland; Mr. Andrew, Kilmarnock; and Messrs. Samson, of the same place, exhibit characteristic groups in different parts of the grounds.

Of hothouse builders' productions there are five exhibitors. Messrs. Boyd & Sons, of Paisley, occupy the nearest position to the main entrance with a wooden conservatory, very handsome, architecturally. The side borders of the house are planted out with the view of showing the intended arrangement internally, and virgin cork screens are employed all round to exclude both the hot-water pipes and the balloon ventilators from view. The exhibit attracts much attention on account of its novel—I had almost written medieval—character. At first sight it suggests the idea that it is a revival of some almost forgotten style, but when examined in detail the conviction that it is admirably adapted for the purposes of a conservatory is at once seen. It is well finished in regard to painting and glazing. The furnishing of Camellias, Palms, Azaleas, Clematis, and Ferns, &c., is done by Mr. Storrie, of Partick, in good style.

A little way off stands the neat conservatory of Messrs. McKenzie & Moncur, of Edinburgh and Glasgow. It is of wood and iron, the roof curvilinear, on lattice girders, supporting an angular lantern, the whole having a light and elegant appearance. It is furnished with a collection of attractive greenhouse plants, and some fair samples of *Odontoglossum Alexandrae*, by Messrs. Austin & McAslan.

Messrs. Lowe & Sons, of Gilmore Park, Edinburgh, and Cornbrook, Manchester, have a very handsome architectural conservatory in wood, similar in character to the one they exhibited at the Edinburgh Exhibition two years ago, but with an improvement in the proportion gained by a little more extension being given to the wings. The ventilating gear is a special feature, it being on the firm's universal joint principle, by which the ventilators in every angle of the most complicated house can be opened or shut by one lever or wheel. Frames of various kinds, boilers, and garden seats form part of the exhibit of the firm.

Messrs. Gardiner, Bellevue, Edinburgh, and Peel & Sons, also of Edinburgh, have samples of their greenhouses for the million, which are marvels of cheapness.

Of rustic seats, arbours, tables, and vases, there

are some fine samples exhibited by Messrs. Smith & Todd, of Stretford, near Manchester, and Mr. Henry Casar, of Knutsford.

Near the main entrance stands a small greenhouse, built by Mr. Paterson, of Pollokshields, which, while well illustrating the work of that builder in providing small houses for amateurs, serves also as a fire-engine station. The engine occupies the centre of the house, and a stage well filled with flowering plants surrounds it. There would be economical as well as other obvious advantages in the adoption of glass and wood or iron in building fire stations, where the situation admitted of light sufficient to enable the men to devote their leisure successfully to the culture of flowers.

Immediately within the main entrance to the exhibition from the grounds is a very fine oriel screen of wood and glass erected by Messrs. Boyd & Sons. The details of the structure and design are similar to those of the conservatory already noticed, and the inner bay formed by it provides space and shelter for an interesting collection of greenhouse and stove decorative plants exhibited by Messrs. J. & R. Thyne, Glasgow. The collection will necessarily be of a varying kind from time to time, as the renewal of flowering and the changing of foliage plants will have to be frequently effected.

Under the great dome, to which the main entrance immediately leads, is a raised circular platform of great breadth, the centre of which is to a considerable extent occupied by a chain of semi-circular fountains, interrupted by rockwork clothed with Ferns. Within this fringe of water and rock a noble group of plants arises, a lofty specimen of *Araucaria excelsa* towering high above all. The base of the group contained, among other notable plants, a grand example of *Rhododendron Dalhouseianum* in full flower. The whole of the plants in this group are from the Botanic Gardens, Glasgow, as are also some fine plants of *Rhaphis flabelliformis*, *Dacrydium cupressoides*, standard Bays, and *Bucklandia populina*, which decorate the angles at the extreme of the area of the dome. From the same source are a number of well-developed Palms, tree Ferns, and other plants, which decorate the orchestra and the angles around the pedestals of the larger statues, and about the several entrances, and also an *Agave americana*, throwing up a flower-stem of such strength as to augur a very fine inflorescence; the stem is at present about 3 feet high. S.

A NEW RANGE OF GLASS-HOUSES AT BYRKLEY, BURTON-ON-TRENT.

THE illustration (fig. 91, p. 633) shows a new range of glasshouses now being erected for Hamar Bass, Esq., at Byrkley, Burton-on-Trent, by Messrs. Forster & Pearson, of Beeston, Nottingham. A new kitchen garden is being formed there of considerable extent, and which is situated on one of the highest parts of the old Needwood Forest, with a slight slope towards the south and west. The subsoil is stiff clay, which has added considerably to the expense of preparing the ground. The main range of houses is 330 feet in length, and consists of a central plant-house, 40 feet by 30 feet, and 22 feet high; four vineries, each 34 feet by 16 feet 9 inches; two Peach-houses, each 31 feet 9 inches by 12 feet; two Rose-houses, 31 feet 9 inches by 12 feet; two greenhouses, 23 feet by 18½ feet; and two stove or Orchid-houses, 28 feet by 18½ feet. At the back of the range is a cool Orchid-house, 30 feet by 12 feet; a fernery, and all the conveniences usually found in a well-appointed establishment. As the ground falls very much at the left-hand end of range, the space under some of the houses has been utilised for Mushroom growing, root stores, and other purposes. There are two ranges of half-span pits—as shown in the illustration—each 100 feet long, which will be provided with sufficient means of heating for all purposes. The whole of the houses will be heated by three of Messrs. Foster & Pearson's Chilwell Nursery boilers made in the improved form with steel tubes.

HOME CORRESPONDENCE.

LADY DOWNE'S GRAPE.—The bunch of the above Grape that I forwarded by rail is an average sample of those grown by Mr. Speed, at Penrhyn for many years past. The Down's were inarched over twenty years ago on to some old Hamburghs of nearly double that age. These Vines although advanced in years annually produce and finish a heavy crop of superb, serviceable fruit that is cut from the Vines about the beginning of the year and bottled in the usual way, but Mr. Speed not only grows them "extra," but succeeds in keeping them very late in the season as fresh and as when cut from the Vine, with very little if any deterioration in flavour, which is a feat worth recording. Penrhyn is situated within a few miles of the sea coast, and consequently enjoys somewhat saline atmosphere that may help to account for their extra good preservation. Where such as these can be grown and preserved there will be little need of the extra hard forcing to meet the demands of the early London season; and as these Grapes are grand travellers it materially adds to their value, and is a consideration in these cutting days of economy. *J. H. Goodacre.* [The Grapes were admirably preserved, being of fine flavour, and appearance, with berries as large as fine Gros Colmars. The bunch was in shape like an ordinary Lady Downe's. Ed.]

SCENT ON SOLOMONS SEAL.—For the information of Mr. D. F. Fish and others (see p. 373) I will relate "my experience." Two years ago I brought home from the garden of a friend a clump of this variety, and, dividing it, the strongest crowns were put into pots, and forced in my greenhouse, while the remainder was planted outside in the flower garden. The result was, that those inside had a very strong scent like that of bitter almonds, sufficiently so to be detected by any person on entering the greenhouse, and those outside were but slightly scented, and then only was the scent perceptible when at a short distance. The reason is obvious: the limited area of the greenhouse favours the concentration of the perfume, but in the garden it "wastes its fragrance on the desert air." *North Norfolk.*

VARIEGATED VINE LEAVES.—We have here a case of one shoot sporting on a Vine, similar to that of your correspondent "W. P." (p. 660). But in our case the fruit formed on the affected shoot never reaches perfection. The Vine in question is Madresfield Court. The sport appeared three years since, the leaves becoming green and white and appearing simultaneously with the other shoots, but the growth being weakly the bunch which shows annually, only lives to reach the blooming stage and then dies gradually away. The foliage in its early stages is handsome in appearance, the variegation being very clearly marked. I look upon the growth as a freak which will after a time die out. Curiously, too, a Horse-Chestnut in the garden here does the same thing every year; it is a young growth from the crown of a tree which had its head cut off at 12 feet from the ground. S.

GARDENER ASSOCIATES. R.H.S.—Mr. Fish (at p. 620) has ably stated his views as to lowering the subscriptions for fellowship so as to admit "practical" gardeners with a vote. It seems to me that your editorial note at the bottom of his letter goes to the root of the matter—the question is one of finance. I do not think the Society could carry out its work fully if it depended for funds on lower subscriptions than one guinea. It must be remembered that each Fellow involves cost now, and that when the Society with more funds becomes more active, this cost will be increased. I believe that the cost for each Fellow for *Proceedings*, notices, &c., will amount to something like 4s. or 5s. a head, so that if the subscriptions were reduced in many cases to 10s. 6d. there would not be much left for general charges. The Council by admitting Associates to the shows, and by placing a "practical" gardener on the Council, have, I think, met the wish that all classes of gardening interests should be represented. "Practical" gardeners have always formed an important part of the Floral and Fruit Committees. A fair number of "practical" gardeners have already become guinea Fellows, and I hope that more will do so; but I think the Society must trust mainly for support from those who get most advantage from its work—the owners of gardens, who learn by the judgments of its committees what are the best novelties in the way of flowers, fruit, and vegetables to introduce into their gardens, and

that if they can only be made to realise what they owe to the Society, they will help it by becoming guinea Fellows if they live far in the country; and if they live near enough London to be able to attend the very interesting "fortnightly" meetings and shows held in the London Scottish Drill Hall, they will often subscribe two guineas for the sake of the extra tickets. Forty-nine owners of gardens within a walk from here have now joined. Other districts please copy. *George F. Wilson.*

RAILWAY RATES AND SALESMEN'S COMMISSION.—"Spade," in your previous issues, does not take up the cause of home growers. Why should they "find their hopes baseless?" It is the home producer who keeps alive the railway system of this country by the use of both luggage and passenger trains. If there is a favour to be granted, who, pray, should be first considered—the foreigner—a casual customer, who can and often does do without you, or the home grower—a daily customer, who cannot, and is compelled to come to you? A circular recently issued by the Railway Companies' Association says:—"A comparison of profit on imported and home traffic shows the former to be the least paying, and the directors think it right" to warn or threaten the many ports of a probable change if the Bill passes in its present shape. This certainly savours of a threat to those ports, if they do not put their shoulders to the wheel and help the railways to retain their right to subsidise the foreigner. As to commission, referred to on p. 628, I submitted to the growers two propositions, viz., a commission of 5 per cent. nett, and one of 10 per cent., the latter to include market tolls, portage, guarantee, and use of empties. The latter is the old style, to which South Hants growers purpose sticking. *J. B. Thomas.*

PHLOX NELSONI.—This white-flowered plant is charming for the spring garden, and we grow it largely. I plant it in large patches alternately with *Aubrietia græca*, and the two go well together. The way to grow these two hardy plants successfully is to take cuttings of the young growths as soon as they get a few inches long, and insert them in good sandy soil in a frame, without any bottom-heat, water thoroughly, and shade heavily for a few days, afterwards gradually removing the shading in the afternoon in order to let the sun temperature in the frame rise by sun-heat to about 75°, giving a gentle syringing at the same time. I have grown them in this way into nice little plants by the end of June. When well rooted they should be planted out in rather a shady border, where they will grow away and make nice plants for putting out after the summer bedders are taken out of the beds. They will flower the first year, and are proof against every sort of weather. *G. Merritt.*

CAN IT BE TRUE?—The note on p. 623 reminds me of another curiosity of American literature. A citizen of Eustis, Florida, is said to have a combination tree in his garden, consisting of a Lemon, Peach, Pear, Grape fruit, Persimmon, Orange, and Guava, all grafted on one stock, and all in bloom. One would think no Editor, either in America or anywhere else, would admit such an absurd statement unless as a joke. *J. W. O.*

VIGOUR AS INFLUENCING SEX. With reference to the Hazel catkin which I lately forwarded to you, and which has since been under the consideration of the Scientific Committee of the Royal Horticultural Society on two recent occasions, I note, in the report of the last meeting, published in the *Gardeners' Chronicle*, p. 566, that Mr. Henslow concluded that "the prolific state of the male catkin, and the presence of female ones (developed from the base of the male), corroborates the conclusion arrived at by Mr. Meehan, of Philadelphia, who observed in various declinous trees that the female flowers were always associated with a relatively greater degree of vigour; or, conversely, that an increased vigour produced female flowers, when, normally, nothing but male would have appeared," and he might have added, that under a still greater degree of vigour or activity the axis of these female catkins might have been prolonged into ordinary growth. My own observations on declinous trees, and, indeed, plants in general, have for long enabled me to endorse the view so ably corroborated by facts produced by Mr. Meehan, that the sexes in flowers are relatively determined by degrees of nourishment: that a greater degree is essential to the formation of female than for male. And being free, so to speak, of this belief at the time I discovered the prolific

catkin, I may state that my faith was considerably shaken after critical examination of the catkin. When I first saw it, I reasoned, in my old faith, that out of weakness (male) had come strength (female), the result of an excess of nourishment. But could this be possible under the circumstances? The spikelets or branches were, some male, some female, and one, at least, which was fully half an inch long, was pistilliferous at the apex, and stamiferous below, while the strong central axis of the proliferous catkin was wholly male. I carefully scrutinised the apex of the latter for female flowers, but found none. I need scarcely say that I had fully expected to find them there. It is, I think, of rare occurrence that the branches of any kind of inflorescence are, individually, as strong as the axis, and it is not my experience that the tips of either male or female catkins of any family are ever, normally, as strong and well developed as the basal or medial portions. If the number of anthers or ovules of, for instance, coniferous tree catkins is variable—say from two to three—the larger number will be found developed on the basal or medial scales. *Geo. Syme.*

THE GREEN-WINGED ORCHIS (O. MORIO).—Just now many of the Kentish hillsides, downs, and fields are rendered highly ornamental by the vast numbers of this Orchid which are scattered about, but particularly where the ground is naturally dry, and the soil of a rich loamy texture. The prevailing colour of the flowers is a deep rich purple (mulberry colour), although light pinky forms are not uncommon, and, indeed, this latter is by far the most ornamental. Half-a-dozen of these Orchids planted closely together in a flower-pot are very attractive, and if kept in a cool sitting-room remain in good form for a considerable length of time. The flowers, particularly in the early morning, are sweetly scented, something between Musk and Almond; but this is not recognisable in all specimens. It is an Orchid of low and humble growth, rarely exceeding 6 inches in height, the flower-spike alone being half that length, while the leaves are of a pale unspotted green. As a cut flower it lasts well, half-a-dozen specimens of unusual size and brilliant colouring having enlivened my sitting-room for several days past. *A. D. Webster.*

STEPHANOTIS FLORIBUNDA.—The merits of this stove climber are too well known to need any description from me; but what I wish to say is, that I find by letting the young growths hang down in a natural manner, instead of tying them up neatly like a faggot, the growths not only get more light and air, and consequently flower a great deal better, but they have a very graceful effect; and when once tried I think few gardeners will again adopt the other method. *G. Merritt, Kington Hoe.*

ROSES DEVONIENSIS AND CLIMBING DEVONIENSIS.—Your correspondent, "Wild Rose," is, I think, in error, on p. 500 in describing climbing Devoniensis as a bud sport from Devoniensis. I have not the number by me, but if "Wild Rose" will look over the *Garden*, vol. i, p. 433, he will find the history of their origin, which is, I think, as follows:—A Mr. Forster, seeing a plant of Smith's Noisette with a ripe seed-pod on it, bought the plant and sowed the seed; two seedlings were raised—one Devoniensis, the other climbing Devoniensis, both of which were sold to the late Mr. Pince, of Exeter, and many others have considered the climber as a strong growing bud-sport. Mr. F. W. Burbidge gives a note on them in his *Propagation and Improvement of Cultivated Plants*, and he very kindly sent me the above reference to their history. *George S. Wailes, The Nurseries, Beverley.* [It is said that Rose Devoniensis was raised from seed by Mr. Foster in 1838, one parent being Smith's (Smith's Yellow), a Noisette of a yellow tint, and also that it was brought to Plymouth from the West of France. There may be some grounds for each statement, but in the absence of precise information on the subject we are inclined to suppose, with Mr. Rivers, Canon Hoole, Mr. W. Paul, and others, that the climbing Devoniensis is a "sport" from the other. It was not till a much later period that we find climbing Devoniensis in our gardens, and this militates against the alleged fact of their both having sprung from the same seed-pod. Ed.]

SQUIRRELS.—No one admires the squirrel more than I do—the merry, active little fellow! One meets him far in the woods, springing from bough to bough and tree to tree, having it all his own way,

and occasionally one sees him in the pasture fields in the autumn gathering Mushrooms; and later on he gets more daring, and comes into the garden, helping himself freely to the finest and fattest Filberts, trotting off to the woods, where the winter store is laid by. But notwithstanding our comical little fellow being amusing in his habits, one is obliged to say that he is no friend to the gardener and forester. Some of the large Spruce trees here were unmercifully eaten by the squirrels last winter and spring; positively in many cases a wheelbarrowful of young shoots of last year's growth was lying under the tree. Curiously enough the squirrels seemed to prefer large and mature trees, but for what reason I know not. Mr. Webster may lay it to the cross-bills, but here I believe the damage is due to squirrels. Some twenty-five years ago I began forming a pinetum, and I have had to regret the loss of many a leader from squirrels. On my table lays an account of the excursion to Balmoral of the members of the Arboricultural Society—a Society to which, by-the-by, every landed proprietor and forester in Great Britain should belong—and there I see that the Pine woods have suffered in many cases through squirrels. In my young days there was not a squirrel on the banks of the Dee from its source to the sea, and even so far north as Gordon Castle; now a man is obliged to be kept to shoot them. But further south the population of the country is more than a match for them, or we should find our finest Fir woods spoiled by their interference. I should be curious to know if the squirrel is plentiful in Norway, and how it affects the Pine woods in that country. *J. Rust, Erildge Castle.*

THE SLIPPER OF THE CYPRIPIEDUM.—I have often thought that this slipper, being so specialised a petal, ought, by the rule of modification with a purpose, to be of some importance to the plant, in its sexual relations to other similar plants. One day, in going over the Orchid-houses of the Victoria and Paradise Nurseries with Mr. Williams, I remarked to him, that the Cypripedium slipper must be of some important use to the plant in connection with cross-fertilisation by insects. He cut open a slipper of *C. barbatum*, and on examining it, he observed, "Probably you are right, as the hairs on the inside appear to secrete something which may be nectar." I took the flower home, and examined it carefully with a magnifying glass. I found that the inner surface of the sole of the slipper is studded with minute transparent hairs, on the tip of each of which was a minute drop of transparent secretion. I could not detect any sweetness in it, but that may be because the amount was too small. Now, supposing this secretion to be nectar, or something of which insects are fond, the structure of the slipper becomes apparent. Its form and peculiarities are evidently intended to facilitate cross-fertilisation. The toe-part of the slipper is a prominent place for a flying insect to settle upon. It would creep over or tumble over the foremost edge into the pouch. The inner surface of the toe part has no nectar-hairs, and so the insect would go up the surface of the sole, consuming the nectar it might find on the tips of the hairs. Let us now see by what route the insect could most readily get out of this pouch. The side edges are sharply incurved, and in some Cypripedia the foremost edge is also incurved, so that the intruder could not readily get out by the sides. At the heel of the slipper there are two openings on each side of the column; the latter consists of a fleshy stigma, bent downwards, an anther on each side, and a sterile one in the form of a bilobed shield, which hides the sexual organs. Each anther is so placed that an insect—say, a small hairy beetle or similar insect—could not easily emerge by the side openings without brushing off one of the sticky anthers, and carrying it to the next flower. The stigma is so placed that an insect with an anther on its back could hardly come up the tunnel formed by the sides and sole of the slipper without brushing against its sticky surface, and leaving there the anther it may have carried away from a former flower. The bases of the two side petals are furnished with hairs, which further restrict the opening, and force the insect to pass out closer to the anther. The upper sepal, with its white and purple stripes, appears to act as a sign-board to catch the insect's eye, the rest of the flower being of a brownish-green colour, and not very conspicuous. It may not be impossible that an insect alighting on the pouch would, by tickling it with its feet, instantly cause some secretion to be exuded from the tips of the nectar hairs through that strange telegraphic or

nervous communication, of which there are many examples in the vegetable world, and possibly the gland-like brown dots on the surface of the pouch may have some such functions. But of this I know nothing. I am not aware that this interesting structure of the Cypripedium slipper with reference to cross-fertilisation by insects has been dealt with before. Anyhow, it appears a case worthy of being studied by travellers in Cypripedium countries. This curious flower must have, in its native country, some curious insect which would act as a carrier of its pollen, and which may have been modified also to suit the needs of the Cypripedium. *E. Bonavia, M.D.* [See *Mueller's Fertilisation of Flowers*, English edition (1883), p. 533, where the process of fertilisation by bees and the use of the pouch in connection therewith is described. See also the account of the "Fertilisation of Coryanthes," in *Gardeners' Chronicle*, May 6, 1882, p. 562. Ed.]

FRUIT PROSPECTS.—Judged by present appearances the coming fruit crop promises well. During my recent journeyings I have seen Pear trees white with abundant bloom, and this is noticeable generally; and within my own knowledge many young Pear tree plantations around here, which, speaking generally, have not borne previously, are at this moment so full of flower as to scarcely leave a sign of a green leaf. An aged standard, Gansel's Bergamot, I have in my own garden, which has never given more than a score or so of bunches of bloom for more than a decade, and which is generally a shy bloomer, so grown, is also at this time equally abundantly flowered. Though I have had two good Plum seasons—last year and the previous one—yet the present season promises to exceed them both, and with all kinds it is alike. I have never before seen the Plum known by the name of French Gage bloom nearly so well, and the blooms are already set. Greenfly seems already very abundant amongst these embryo fruits. Cherries are equally prolific of flowers, Morellos being charming to look upon. Apples are mostly promising well, especially Wellington, Striped Beaufin, Alfriston, Alexander, and Hlawthornden. Fig trees have embryo Figs, or fruits, at every joint, which hereabouts is most unusual. Apricots suffered severely from the very cold cutting winds which prevailed during the whole time they were in bloom. Filberts seem to promise well. Bush fruits and Raspberries give great promise. Strawberries are likely to suffer unless warm rains come quickly to their aid. *William Earley, Essex.*

—There is an old saying, that you should never prophecy unless you know, but I think it will be pretty safe to predict a full crop of most kinds of hardy fruit, for Cherries and Plums are new set, and surely they will escape frost after this of sufficient severity to do them much injury. Pears are having a good time of it in unfolding their blossoms, of which they have great wealth. Apples, too, are swelling their buds fast, and before this is in print they will be open, as with the strong sunshine and warmth we are at last favoured with, they will come on with a rush, and must swell fast when they once are set. It is to be hoped, that the embryo fruits will escape maggot, with which they are so often affected when growth is slow, as then the pernicious insects have every chance of curling the foliage and spinning their webs, which hold the leaves as with a knot. Bush fruits are showing well, but Strawberries are not over-strong, as the weather was too hot and dry last year for them to make very strong crowns. Apricots are almost a failure, but Peaches and Nectarines are plentiful where the trees are on favourable aspects, but the leaves are showing some blister. *J. S.*

DOES IVY CAUSE INJURY TO TREES?—I beg to make a few remarks from my experience as to the Ivy being in any way injurious to trees. I do not consider it the least so, unless it gets quite up in the head of tall trees. I have, perhaps, hundreds with it up the stems and right up the branches in many of them, but being, as a rule, pollard trees, it gets cut off when the tree is lopped, which would be about every six or seven years; but a year ago this winter I had a number of them of different heights, pollards and timber too, covered from the bottom all up the trunk as high as 40 feet in some of them; this, when the trees were shrouded, I had cut, about 6 to 7 feet from the ground (this was where my walk was) right through to the stem, and pulled quite clean off from top to bottom to where cut; they then looked very clean after removal, but it was a very hard job to get it off, it was so very closely grown, and with the branches it was still more difficult to do it. In other

cases I had it cut close to the ground and treated the same. The trees are as healthy as if they never had been covered, and some of it now remaining, as I stated, spreads a yard from the tree. If allowed to get

off, it matters nothing, only the unsightliness and litter; as in time it will let go its hold and fall off. I have three Lombardy Poplars in one of my gardens about 60 feet high, as near as I could judge; one is

distance, and it was cut off as some part of it died through being broken; but the base of this is 7 to 8 inches diameter at the ground. On the former one it spreads out about 4 feet from the stem, and hangs down in length about 6; and the other one had none growing on it at one time, and the great difference that some would perhaps think there would be in the trees is not perceivable, so that one can suppose it is not detrimental. These three trees are just about the same in height and in healthiness, and the Ivy has been growing on them about forty years, as it was planted when I was a boy. In this case the Ivy is burst in many places, as it would be by a fast-growing tree. On those I had stripped of it, it is going up them again at a rapid rate, and doubtless it will be left to do so till the time for the wood to be again cut. I should, if I had any to stop from going up the trees, cut it at any height I wished, and let it remain, or pull it off, as I felt disposed. It is a good thing up a building to keep it dry, providing the wet does not trickle down from the top, as then it would soak into the building and damage it. On an overhung house, when well kept, it keeps it dry from driving rains, and looks very nice, especially in the winter. I am myself an admirer of it, as well as a grower. J. S. C.

— This question may be answered in the affirmative in the case of park and garden trees when the growth of Ivy is very heavy, and has the effect of smothering the annual growths in its embraces, and when it so fills up the centre of the head that sun and air are both shut out in a large degree. Ivy on young trees of whatever species is always injurious, for the above reasons, and also because of the exhaustion of the soil caused by its greedy roots. Old trees and those of large size are not injured by Ivy; in fact, Ivy will often add much beauty to the aspect of a tree in the period of decay. The trees which I have found to suffer most from a garment of Ivy are Conifers and Holly, Laurel, and the like; and many instances have come under my notice where Larch and Spruce Firs of 70—80 feet in height have succumbed to a heavy load of Ivy. Under good forest management Ivy is sedulously cut away from all trees of less than fifty years old, the forester doubtless acting on the knowledge that Ivy has an injurious effect in curtailing growth by clasping the stem and robbing the soil of matters which should go towards forming timber. It is questionable if trees which have had their covering of Ivy cut off at the ground have been killed by the loss of this protecting covering, but rather that the trees were killed by the living Ivy. The trees would show signs of decrepitude really brought about by the Ivy, and the removal of the latter came too late to be of any service. F. M.

HARDY FRUIT PROSPECTS IN IRELAND.

During my experience of something over ten years in this country, I have never before seen the prospect of all kinds of hardy fruit so bright. Plums, Pears, and Cherries have been for the past fortnight a sheet of bloom, and are now in most cases fairly set. Currants, both black and red, especially the latter, are very good; Gooseberries, too, are equally abundant, but quite ten days later than last year. Apples promise well; some are now in full bloom, others are just unfolding their flowers. At present everything has the promise of a good fruit season; in fact, the best that I have seen on this side of the Channel, and equal to any I ever remember to have seen in England. No doubt the almost tropical summer of 1887 ripened the wood thoroughly. H. Taylor, Heywood Gardens, Queen's Co.

THE WAGGON TAX.

— Exemptions to the incidence of the proposed waggon and wheel tax grow apace, as the Chancellor of the Exchequer now has intimated that the vans of market gardeners who are also nurserymen and florists would be exempt, if used entirely in the conveyance of the produce of the land. Of course it is now obvious that all market-garden vehicles otherwise subject to the tax will be exempt as agricultural vehicles, rather a big exemption around London and other large towns, and one of which those engaged in other useful and not less essential occupations not agricultural may well complain. It must not be assumed, however, that every vehicle employed by market growers will be exempt, because the cartage of coal or coke, pots, and similar essentials, with many other things indispensable to gardening, in its various branches, may not be regarded as agricultural by the ever suspicious inland revenue officials, and would soon become intolerable were all such vehicle proprietors to be subject to perpetual

FIG. 91.—NEW RANGE OF GLASS-HOUSES ERRECTED AT HURLEY GARDENS, BURTON-ON-TRENT. (SEE P. 691.)

up into the head of a tall tree it will then, I believe, outgrow and smother them; but in the case of a tree being covered I should cut it through at any point of height I thought fit, and as to its being left on, or pulled

covered with it for about 40 feet up, and the stem of it at the base is 10 inches diameter; and another was covered nearly as much, but the tree having burst the Ivy, the wind blew it down for a considerable

espionage. The fact that the further consideration of the Waggon Tax Bill was deferred until after the Whitsun holidays leads to the hope that it may yet be withdrawn. It seems to have proved unexpectedly objectionable, and has created an amount of antagonism which cannot be disregarded. Satisfactory as it may be to market gardeners to find themselves thus exempt, honourable men cannot but feel that such exemption is very unfair to other trades. The position of the nurseryman who is not a market gardener is not defined, but he will doubtless claim exemption also. *Spindle*.

ARAUCARIAS AT DROPMORE.—During a recent visit to Dropmore, where the heavy rains have proved of immense service to the trees and shrubs, I noticed that Araucarias had suffered appreciably from the effects of the last season's drought, with the exception of the grand male specimen, which remains the noblest of its kind in the country. Acting, doubtless, upon what were held at the time to be correct rules by Mr. Frost, a clump of fine trees was planted on mounds in one part of the grounds, here the trees suffered considerably, the lower branches having either died wholly or in part, so that the trees bear a very rusty aspect. The result seems to establish the fact, that planting on the flat, is best for Araucarias where the soil has only a moderate degree of moisture. The tree above referred to—a really magnificent specimen—and one which should be seen only after all the others have been examined, is also planted on a mound, but still is close beside a large pond, where no doubt its roots receive considerable nutriment. As it was, however, Mr. Herrin, who is materially improving the general aspect of the gardens, found it needful last summer to make a large trench of soil round the tree, and have liberal quantities of water poured on to the roots. With respect to the fine Douglas Fir, and to a second fine specimen in another part of the grounds, and the harm done to other fine specimens elsewhere, the inference seems to be that it is undesirable to plant it largely, as the wood is so very brittle, heavy snow storms doing them incalculable mischief, whilst most other Coniferae escape. *A. D.*

SPIKES OF STOCKS.—A schedule of prizes which has just come to hand has a class for four Ten-week Stocks, single spikes. In another part of the schedule is found another class—six Ten-week Stocks. Now what is meant by a spike of a Stock? I find that at country shows whole plants, including of course the central spike and side branches of flowers, are exhibited as spikes, in some cases only the centre flower stem is exhibited. There is therefore no uniformity of practice as to showing spikes of Stocks. Now it would be reasonable to suppose that what is required in the schedule above referred to is a single spike or flowering stem in the first case, and an entire plant in the latter. At the same time it is probable that plants carrying all their flowers are intended in both. It is one of those knotty points that often occasion a good deal of feeling where disqualification takes place, and I have always adopted the practice, where there is no positive restriction to the contrary, of giving the best prizes to the best examples of Stocks. At the same time there are judges who act upon rigid rules of interpretation who would no doubt say that my action is altogether wrong. The present method of exhibiting Stocks is a barbarous one. The invariable practice is to wash the soil from the roots of the plants, and stick them into bottles of water, but in a close tent they soon begin to fade, and look wretched things in an hour or two. Some exhibitors do not even place their plants in water, and they droop when laid upon the exhibition table. If the prizes were offered for Stocks grown in pots, a much more satisfactory result would follow. I mean grown in pots, not plants lifted from the open ground two or three days before, and placed in pots merely for the show day. *R. Dean*.

VICOMTESSE HERICART DE THURY STRAWBERRY.—I have often seen this fine early Strawberry doing so well at Heckfield under quick forcing, that I have wondered not to have found it in every garden similarly employed. Still for first forcing it is perhaps less generally employed than is the old Keen's Seedling. But having read of the assumption by Mr. Wildsmith, that either air or soil specially favoured the variety at Heckfield, I was very much interested on entering during the spring one of the large Strawberry-houses at Crosby gardens, Hounslow, where Mr. Thompson grows fruit for the Messrs. W. & E. Wells, to

find fully 1000 plants of the Vicomtesse in bloom and in fruit, and looking almost as well as the Heckfield plants usually do, in spite of the fact that last summer's drought rendered the getting of strong runners exceedingly difficult. All the plants were in rather small 32's, and very dwarf indeed in appearance. The length of leaf and flower-stems of the Vicomtesse and President in another house was most marked. The soil, though made very firm, is not very rich, for it is found better to use stimulants the moment the flowers have set, in preference to having it bodily rich before potting. Usually Clay's Fertiliser is employed, a little of the manure being occasionally sprinkled over the surface of the soil; but this year, for the first time, a new manure, called the Combination Fertiliser, and Jensen's fish manure, are being used, and their effects will thus have a fair and interesting test. Any little moss on the surface is soon destroyed by the manure. When the bloom is set well, it is thinned down to some twelve or fifteen fruits to each plant, and tied up as erect as possible with some two or three short sticks for supports. One-half of the foliage is also removed, so that the plants may thus get all possible air. Too much foliage retains moisture, and is thus apt to generate mildew. This Mr. Thompson regards as the only enemy in Strawberry forcing, and is best battled against by making the pipes as hot as possible, and then filling the house with a dense sulphurous vapour, by washing the pipes with sulphur mixture. The Strawberry-houses at Hounslow are some 100 feet long, and have open trellis-stages on either side, whilst a single-row shelf runs through the length of each house overhead. The plants stand in rows of five, cross-wise on either side, 1 foot apart, so that, inclusive of the top shelf, there are really some 1200 in each house. Other houses contain President and Sir Charles Napier. Sir J. Paxton is with some growers a favourite, but the softness of the fruits seems to promote mildew to an unusual degree, whilst they are less adapted for packing. When I looked in, some time since, the best fruits of Vicomtesse Héricart de Thury were just showing colour. There is no necessity to force earlier than from the middle of April onwards, and when whole houses are fruiting at once, it is obvious that many thousands of plants are needed to continue the supply of fruits until July, for in market work it does not answer to make a start and then collapse. Later these Strawberry-houses are filled with Tomato and Cucumber plants, grown on a ridge of soil on either side, laid on wood or stone slabs. In other houses, Peaches as large as Walnuts were a splendid crop, and Madresfield Court Grape will be worth seeing. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

TUESDAY, MAY 22.—Present: D. Morris, Esq., in the chair; and Messrs. G. Murray, G. F. Wilson, F.R.S., J. O'Brien, W. G. Smith, Boulger, A. D. Michael, R. McLachlan, F.R.S., Professor Church, Dr. Lowe, and Dr. Masters, F.R.S.

Lily Disease.—Mr. George Murray reported that the specimens sent were too much decayed to examine satisfactorily. Probably the appearance was due to fungus, Peronospora or Ovarularia, or both.

Monstrous Cattleya.—Mr. Ridley sent a report on the Cattleya exhibited by Mr. Snee at the last meeting:—"This Cattleya is a good example of petalody. The bract subtending the flower is replaced by a petal. The dorsal sepal is lip-coloured, as are the laterals, but in a less degree. The left petal is also lip-coloured, and has the same shape as the lip. The right petal is adnate to the column, and lip-coloured; at about three-quarters of its length from the base it bears an anther cap on its edge—of course, abnormal and abortive. The lip is tolerably normal, but not lobed. The column seems to have entirely lost the staminal whorl; clinandrium and anther being absent. The rostellum and stigma are present."

Jaborandi.—Mr. Morris reported that the specimen exhibited by Mr. Lynch at the last meeting was the true plant, *Pilocarpus pennatifolius*, which yields the medicinal substance above named.

Fertilisation of the Scarlet Runner.—With regard to Mr. Burbridge's remark at the last meeting, that the Scarlet Runner does not set its fruit in South

America, but in this country it fruits freely, owing to the bees, which bore through the base of the flower," Mr. Henslow observed, in a note communicated to the Committee, that this was an error, as no flower is benefited by the perforations made by insects from without. The bees fertilise them, however, in the legitimate way; but in their absence the Scarlet Runner can scarcely fertilise itself. The French Beau, on the other hand, is quite self-fertile, as horticulturists can force it in winter. The reader is referred to Mr. Henslow's article on the "Fertilisation and Perforation of the Scarlet Runner," in the *Gardeners' Chronicle*, November 2, 1878, p. 561, fig. 97.

Shoots of Spruce Fir Injured, &c.—Referring to the specimens exhibited on the last occasion Professor Boulger suggested that the injury might have been occasioned by hail. The general consensus of opinion, however, was that the damage was, as previously stated, effected by squirrels. Mr. McLachlan alluded to the death of large Hollies in consequence of the "ringing" of the bark by rabbits. Similar injuries were detailed as caused by deer.

Self-coloured Tulip.—A pale primrose-coloured Tulip, shown by Mr. Walker, was referred to Mr. Baker for report. It had occurred among a bed of *T. Gesneriana*, of which it is, in the opinion of Mr. Baker, only a seedling form.

Catascum.—A specimen was referred for name, and considered to be *C. viride* (*Monacanthus*).

Scilla Bulbs, &c.—Dr. Lowe showed elongated bulbs of *S. campanulata*, which were referred to Dr. Masters for examination and report.

Iris.—Dr. Lowe also showed a yellow flowered Iris he had originally received from the late Rev. Harpur-Crewe, and which was referred to Mr. Baker for examination. Mr. Baker reports it to be *I. lutescens*.

Tetramerous Pear.—Professor Boulger showed flowers of a Pear in which the parts were in fours.

Notched Lilac Leaves.—Mr. Boulger also showed some leaves of Lilac which, owing to close adhesion one to the other, had developed a little notch or rather lobe, on one side of the obstruction.

Sphinx ocellata.—Mr. Roupell sent a specimen of this moth in illustration of "mimicry," the dull colour of the upper wings approximating to that of the dead leaves of the Apple, on whose branches it rested. This view did not find favour with the entomologists present.

Beetle attacking Mangels.—Hon. and Rev. J. T. Boscawen sent specimens of a beetle which attacks Mangels. Referred to Mr. McLachlan.

Himalayan Primula.—Rev. C. Wolley Dod sent a specimen with the following communication:—"In the winter (January, 1886) I received amongst many others from Dr. King a packet marked *Primula reticulata*. This produced in April, 1886, a fine crop of *P. sikkimensis*. When these were removed, there came up in the spring, 1887, a small crop of very delicate seedlings, all with distinctly cordate leaves, and very different from *sikkimensis*. I sent a few away. Those I kept have nearly all been cleared off by the 'leather jackets.' I enclose the largest left. I cannot make it fit any species described in the *Flora of British India*. The calyx does not seem to fit *reticulata*. It is three weeks earlier than *P. sikkimensis* under the same conditions. *C. Walley Dod, Edge Hall, May 21.*" The specimen was referred to Kew for comparison, and has been determined as *P. glabra*.

Cynomorium coccineum.—Mr. Morris showed a fine specimen of this curious parasitic plant from Gozo, whence it had been received from the Governor of Malta, Sir Lindont Simmons. This is the fungus *melitensis* of old writers, and was formerly considered as an astringent; so highly was it valued that the plant was placed under the protection of a special guard.

Canker of Marsechal Niel Rose.—Mr. Froud, gr. to G. N. Marten, Esq., sent a portion of the stem of this Rose cut at 6 inches below the soil. The plant was covered with buds which failed to open, and on examination the stem was found cankered. The specimen revealed traces of old injury rather than of present mischief, the appearances being possibly due to the attacks of fungus. Mr. Morris remarked that Marsechal Niel was the best Rose for the tropics, where it is not subject to canker.

Double-spotted Richardia.—Mr. H. Tull exhibited a specimen of *Richardia aethiopica* with a double spathe—a common occurrence.

Dendrobium Flower on the New Growths.—The same exhibitor sent a specimen of this not very uncommon occurrence, which is analogous to the midsummer shoots of the Apple.

Conifers.—Dr. Masters showed specimens of

Juniperus flaccida, a very elegant species from the highlands of Mexico; also fine cones of *Araucaria Bidwillii* and *Pinus pinea*, received from M. Naudin, Villa Thuret, Antibes.

FLOWERS FROM KEW.

Specimens were exhibited of the following!—

Iris Korolkowi.—A species received from Herr Max Leichtlin in 1885, and now flowering for the first time at Kew. It seems to be a variable plant, as the figure in the *Garten-Flora* differs in colour from the one exhibited, in which the falls were of a pale lilac or grey-colour, with narrow lines of purple, and with a deep purple-fringed blotch at the base. The grey standards are also lined with purple veins.

Ferula (Narther asafetida).—A handsome but atrociously smelling Umbellifer, with boldly cut glabrous foliage and umbels of yellow flowers like those of the Parsnip. It is interesting as being the source of the drug asafetida.

Saxifraga Kolnatiava.—A Siberian species of dwarf habit, with leaves like those of the Aizoon section and flowers not unlike those of "London Pride."

Allium Suwarowii.—A species with globose many-flowered umbels; flowers about half an inch across, segments spreading, narrow oblong, rich violet; stamens of the same length and colour.

A. Jesdianum.—A species with globose, many-flowered umbels, individual flowers nearly three-quarters of an inch in diameter; segments linear-oblong, spreading, ultimately bent downwards, pale lilac; stamens erect, whitish, longer than the perianth segments.

BATH FLORAL FETE.

MAY 16.—This exhibition, which was held as usual in the Sydney Gardens, had some fine features; indeed, it was considered one of the best held in Bath for several years. The weather was favourable, and a numerous company was in attendance.

Orchids were an excellent feature. The best six plants came from the Rev. E. Handley, Bath, a remarkably good lot, consisting of *Vanda suavis*, *Cattleya Skinneri*, with forty-five well-coloured flowers; *Cattleya Mendelii*, *Miltonia vexillaria*, *Lælia purpurata*, and a very fine piece of *Cypripedium Lawrenceanum*. There was no other competitor. He also had the only single specimen, a superb *Lælia purpurata*, with five fine heads of bloom. He was also 1st with four specimens, staging *Vanda suavis*, *Lælia purpurea*, with six flower-heads; *Cypripedium caudatum*, finely bloomed; and *Cattleya Mendelii*. The name of the exhibitor of the 2nd prize lot did not transpire.

The best single in the amateurs' division was a superb piece of *Aerides Fieldingi*, with two massive branched spikes, from Mrs. Gouldsworth, Trowbridge, the Rev. E. Handley being 2nd, with an example of *Lælia purpurata*, even finer than his previous ones, this having six flower-heads, carrying about twenty-five fine blossoms. Mr. Handley also had the best group of *Orchids*, small plants of good varieties, mingled with *Palms*, *Ferns*, &c., edged with the striped basket grass and *Isolepis tenella*; 2nd; R. B. Cator, Esq., Bath.

Stove and Greenhouse Plants.—The best twelve specimens came from Mr. James Cypher, nurseryman, Cheltenham, and included a very fine piece of *Pimelea spectabilis*, over 6 feet through; *P. Hendersoni*, *Erica almis*, *E. Cavendishiana*, *E. ventricosa magnifica*, *Darwinia tulipifera*, *Aphellexis macrantha purpurea*, *Anthurium Scherzerianum Wardii*, and also *A. Cypheri*, and *Azalea Duc de Nassau*; 2nd, Mr. Mould, gr. to E. Bryant, Esq., Bath.

Mr. C. Gardiner, Bath, had the best nine specimens, the leading ones being *Clerodendron Balfourianum*, *Anthurium Scherzerianum*, *Ixora Williamsi*, *Erica Cavendishiana*, and *Aphellexis macrantha purpurea*; 2nd, Mr. H. Jones, gr. to C. Doherty, Esq., Bath.

The best specimen stove and greenhouse plant was *Pimelea spectabilis*, from Mr. Cypher; Mr. C. Gardiner coming next, with *Anthurium Scherzerianum*.

The best new or rare plant was *Cypripedium Sanderaianum*, from the Rev. E. Handley; Mrs. Gouldsworth coming next, with a good variety of *Cattleya Mendelii*, named *superbua*.

Azaleas.—Some very fine plants are always grown in or near Bath, and Mr. W. Long, gr. to C.

Gardiner, Esq., must be congratulated upon his well grown and flowered specimens. His group of twelve comprised—*Iveryana*, *Duc de Nassau*, *Souvenir de Prince Albert*, *Stanleyana*, *Roi Leopold*, *Mr. Turner*, *Charmé*, *Stella*, *Criterion*, and *Model*. Mr. J. Cypher had the best nine, and they were in the form of large bushes, the leading varieties being *Extranei*, *Charles de Buck*, *Roi d'Hollande*, *Jackson's Grand Crimson*, and *Cedo Nulli*. Mr. S. G. Francis, gr. to Captain B. Smith, Bath, had the best six, *Jean van Geert*, *Roi d'Hollande*, *Souvenir de Prince Albert*, and *Duc de Nassau*, being the leading plants. Mr. E. Bryant was a good 2nd.

Roses in Pots.—A very good collection of six plants came from the Rev. E. Handley—the varieties *Edward Morren*, *Madame Lacharme*, *Madame Thérèse Levet*, *Souvenir d'une Ami*, *Merveille de Lyon*, and *Earl of Pembroke*. Mr. R. B. Cator was 2nd. The Rev. E. Handley also had the best group arranged in the form of a circle; Mr. R. B. Cator being again 2nd.

Pelargoniums.—Some remarkably good plants of these were staged, combining excellent growth with sterling heads of bloom. The nine plants from Mr. G. Tucker, gr. to W. P. Clarke, Trowbridge, included *Triomphe de St. Maude*, *Lady Isabel*, *Rob Roy*, *Alfred Kingston*, and *Digby Grand*. Mr. C. Doherty was 2nd. They were also shown in sixes.

Other flowering plants comprised some excellent *Calceolarias* from Mr. Cole, gr. to S. Treadwell, Esq., Bath; and he was also 1st with some excellent *Cinerarias*. Mr. W. Robertson, gr. to Lord Justice Lopes, Westbury, was a good 2nd, with *Cinerarias*; and Mr. W. Burbridge, Comberley, with *Calceolarias*. *Heaths* were in good form from Messrs. Cypher and Bryant, the former being 1st with six, and also with a single specimen.

Foliage Plants.—Mr. J. Cypher was 1st, with a valuable and effective group of fifteen, comprising *Kentia balmoreana*, *K. Fosteriana*, *K. australis*, *Cycas circinalis*, *C. undulatus* and *C. revoluta*, *Encyphalartos villosus*, *Pritchardia pisifera*, *Phormium tenax variegata*, *Crotons Disraeli* and *Sunset*, &c.; 2nd, Mr. J. Curry, gr. to Colonel Pepper, Salisbury. They were also shown in groups of nine and as single specimens.

Exotic Ferns were staged in groups of twenty plants, Major W. P. Clarke being 1st, with a very bright lot, which included a capital piece of *Athyrium Gorringtonianum tricolor*, a plant slow to grow, but highly effective from its distinct marking. Mr. E. Bryant was 2nd. Groups of nine and single specimens were also shown.

Cut Flowers.—*Roses* appropriately led the way. Mr. R. B. Cator had the best twelve, showing some good blooms, the Rev. E. Handley being 2nd. *Tulips* and *Pansies* were fairly good. The best twenty-four varieties of cut flowers came from Mr. W. Fidler, gr. to Baron C. de Tuyl, Chipping Sodbury—a very fine lot; Mr. G. Hoste, gr. to Lewis Fry, Esq., M.D., Bristol, being a very good 2nd. *Eperges* and bouquets were also well done.

Fruit.—The best dish of thirty fruits of *Strawberries* came from Mrs. Gouldsworth, and probably Messrs. Veitch & Sons were never before seen in better form. *Strawberries* were also shown in groups of six pots. Some well preserved *Apples* and *Pears* competed in classes set apart for them.

Vegetables were remarkably well shown in collections of nine and six varieties, and prizes were also offered for *Cucumbers*, *Mushrooms*, *French Beans*, *Peas*, *Potatoes*, *Asparagus*, &c.

Wild Flowers.—Collections of these, botanically arranged, are always a good feature at Bath, and they were seen in excellent character on this occasion. Each stand must consist of twenty-four species, collected within 12 miles of Bath. This is a much more interesting method than that of merely bunching up the flowers in the form of a bouquet, and decidedly better from an educational point of view.

Miscellaneous Exhibits.—A charming group of *Japanese Maples*, *Orchids*, flowering plants, &c., was set up by Messrs. R. Veitch & Sons, nurserymen, Exeter; and from Messrs. G. Cooling & Son, nurserymen, Bath, came a fine group of plants, also *Roses* in pots, cut blooms of the same, &c. A First-class Certificate of Merit was awarded to *Rosa himalaica*, a large well-formed single white type, apparently closely allied to *R. Brauniana*, shown by Messrs. Cooling & Son. A stand of blooms of excellent fancy *Polyanthuses* was sent from the Zoological Gardens, Clifton.

LONDON AGRICULTURAL SEED TRADE ASSOCIATION.

ON Monday evening last, at the Holborn Restaurant, High Holborn, the annual dinner of this Association was given. The chair was occupied by Mr. Arnold Moss (of the firm of Messrs. Jacob Wrench & Sons, King William Street, City), Mr. F. Bryant, vice-chairman. There was a large attendance, including Mr. N. Sberwood, Mr. Peter Veitch (Exeter), Mr. C. Bates, Mr. W. J. Nutting, Mr. W. Richards, Mr. W. G. Pearson, Mr. F. J. Rust, Mr. J. Kay, Mr. Lovegrove, Mr. G. Marcuse, Mr. Paton, Mr. F. Sharpe, Mr. J. S. Watkins, Mr. Cutler, Mr. David Allester (Secretary), and other gentlemen.

After dinner the Chairman proposed "The Queen," which was drunk, and "God save the Queen" was sung; and having proposed the "Prince and Princess of Wales, and the rest of the Royal Family," which was enthusiastically drunk, and the other customary toasts, he gave the toast of the evening, "Prosperity to the London Agricultural Seed Trade Association." He said he would not detain them very long by going into full details, but he would ask them to consider whether it was possible to put the Society upon a better basis than it was at the present time. That was a matter which they would have to decide. He thought there was room for improvement. What they really wanted was more members, both London and country, and he sincerely trusted that as time rolled on its members would rapidly increase in numbers. There were, he regretted to say, a great many London and country seed merchants and agriculturists who were not aware of the existence of the Association. Let them, therefore, put their shoulder to the wheel and endeavour to make it known and to secure members. The Society was now in its tenth year, and had done, and was still doing, great good, he was glad to say, to those connected with agriculture. Everything in his power to promote the Society's welfare he would willingly do. There was one gentleman's face which was conspicuous by its absence. He referred to Mr. David Syme. This gentleman had written to say that he would like to have been present, but his health would not allow him to come. That gentleman, as they well knew, worked diligently for the Association, and he would have been pleased to see him present that evening to speak upon a subject which he knew more about than he (the Chairman) did. Again, he would urge them to use their utmost endeavours to secure members, especially country gentlemen. It had just been mentioned to him that a better title, it was thought, for the Association would be "The London and Provincial Agricultural Seed Trade Association." He thought so, too, and would bear the suggestion in mind.

Mr. W. J. Nutting proposed "The Agricultural and Commercial Interests" in appropriate terms, to which Mr. Hugh Aiton replied. Other toasts followed, which were duly responded to, and a hearty vote of thanks to the Chairman for presiding having been given the proceedings shortly afterwards terminated.

EDINBURGH BOTANICAL.

MAY 10.—The Society met this evening at the Royal Botanic Garden, Dr. Craig, President, in the chair. The following communications were made:—

1. "List of Plants observed in West Sutherland by Mr. Archibald Gray, with Notes on the Flora," by Lionel W. Hinxman, H. M. Geological Survey.

2. "A Review of our present Knowledge regarding the Colouring Matter of Plants (Part III.)," by P. Sewell.

3. "Obituary Notice of Professor Asa Gray," by A. Taylor.

4. "On Temperature and Vegetation at the Royal Botanic Garden," by R. Lindsay, Curator.

5. "On Temperature, Vegetation, &c. in the Botanic Garden, Glasgow," by R. Bullen, Curator.

Open-air Vegetation during April in the Royal Botanic Garden, Edinburgh.—During the month of April vegetation made very slow progress, frequent sharp frosts and cold easterly winds having prevented any rapid growth from taking place. Many deciduous trees and shrubs were still in their winter condition at the end of the month. Hardy herbaceous plants are also behind their usual time of flowering. No appreciable injury has been observed from these late spring frosts except this retardation of growth. The thermometer fell below the freezing point on eleven occasions; the lowest readings were registered on the 1st, 5th, 7th, 8th, and 9th of the month, when the glass fell to 25°, 26°, 26°, 25°, and 22° respectively.

The lowest day temperature for April was 42°, which took place on the 23rd, and the highest day temperature was 64°, on the 17th of the month. The total amount of frost for the month is the same as for April last year, viz., 58°.

The collective amount of frost registered this season, up to the end of April, is 589°, as against 520° for the same period last year. The following is the distribution for each month:—October, 31°; November, 49°; December, 132°; January, 67°; February, 121°; March, 131°; April, 58°. The lowest point reached this season was 19° Fahr., or 23° of frost, which occurred on February 16.

On the rock garden 137 species and varieties of plants came into flower during the month, being 22 less than for last April. Amongst the most conspicuous were:—

Androsace Laggeri	Narcissus Eystettensis
Aubrieta Leichtlini	„ incomparabilis and vars.
„ Hendersoni	„ rupicola
Anemone fulgens	„ triandrus
„ Robinsoniana	Petrocallis pyrenaica
„ pulsatilla	Polygala chamaebuxus
Dentaria pentaphylla	„ purpurea
„ triphylla	Primula ciliata purpurata
Daphne Blagayana	„ decora
Corbularia Graecki	„ mistassinica
Erythronium giganteum	„ eschmiana
„ roseum	Soldanella montana
„ Nuttallianum	Trillium grandiflorum
Gentiana verna aestiva	Tulipa pulchella, &c.
Narcissus bulbocodium	
„ bicolor and vars.	

Of the forty spring-flowering plants annually recorded to show their periods of flowering nine came into flower, thus completing the list for the thirty-eighth year.

No.	Name of Plants.	First Flowers opened.		
		1886.	1887.	1888.

Extract from Report on Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, for April, 1888. —During the month frost has been registered on

eleven nights, the lowest reading being 7° during the night of the 8th. Total frost recorded, 37°, and that mostly confined to the early part of the month; but although the degrees of frost registered have been a little below the average, we have experienced an unlimited supply of cold east and north-east winds. The weather altogether has been variable, often appearing as a "reminder" that "many a sunny morning turns out a cloudy day." Comparatively little progress has been made in the development of leafage, and the changeable nature of the weather has retarded all kinds of outdoor garden work. All except the hardiest kinds of annuals are still safest in their seed drawers.

SCOTLAND.

ORCHIDS AT EASTWOOD PARK, GIFFNOCK.

This place is about 5 miles to the south of Glasgow, in a rural district, with a surprisingly pure atmosphere.

Mr. Tod is devoted to horticulture generally, but Orchids are his special study and delight. Odontoglossum is the most favoured genus, and the collection of rare and valuable species and varieties is rich and extensive. A large span-roofed house is almost exclusively devoted to this genus. Many were in flower at the time of our visit, and a finer display it has rarely been our good fortune to see; the free and vigorous character of the inflorescences was remarkable everywhere. Several forms of O. crispum were of rare excellence—one in particular, deeply tinted and shaded with purple-rose, and having flowers of the unusual dimensions of 5 inches diameter, and of good substance, is much valued by Mr. Tod. Of other forms in bloom there were grand specimens of O. Pescatorei: one in particular deserves special mention, it having five spikes, bearing in all about 200 fine blooms. O. tripudians grandiflorum was showing twelve fine spikes. Several varieties of O. Hallii were in flower, showing the variable character of this excellent species. O. mulus was just throwing up its spikes, and the interesting O. Wilckeanum was flowering profusely. A fine healthy plant of O. luteo-purpureum maculatum showed a bold spike with grand flowers. O. gloriosum appeared in several splendid forms, along with forms of other species too numerous to mention. Amongst rare things not in flower were O. elegans, showing three fine breaks; O. hebraicum, O. Coradinei, O. Andersonianum, the latter with pseudobulbs of enormous size, measuring about 5 inches by 5 inches; O. Jenningsianum, O. nevium, O. Harryanum, &c.

Of Cypripediums there is a very full collection of the most admired species, varieties, and hybrids. There were C. Maulei, Chantini, and punctatum violaceum of the insigne section in splendid plants, along with C. Dominii and others of the hybrids, and such species as caudatum and others of equal interest.

Dendrobium are grown in limited numbers only, D. Jamesianum, D. infundibulum, D. Ainsworthii, D. densiflorum, D. Wardianum, and D. Devonianum being the most conspicuous.

Masdevallian in flower were fine, and included samples of M. Harryana, the bull's blood var., M. H. Dennisoniana, M. ignea Massangeana, M. Chelsoni x, M. Lindenii, and its var. grandiflora

Miscellaneous specimens noticeable were fine Epidendrum vitellinum majus in exceptional vigour, with spikes a foot or more long; Mesospinidium sanguineum and vulcanicum, Miltonia vexillaria, of which many plants are grown, in fine health; Ada aurantiaca, glowing in its rich orange-scarlet in fine contrast with the masses of light tinted Odontoglossum around; Lycaste Skinneri alba, Oncidium macranthum O. ramosissimum, and others. Calanthes in all the forms are well grown. Mr. James Ewart, the gardener, while showing in every department commendable skill, proves himself a master amongst Orchids.

The only other special feature at present is a fernery in rockwork, which is one of the most perfect things of the kind we have seen under glass.

Entering at one end of the house the visitor is introduced to an enebatingly pretty glen, with rugged craggy sides, which are luxuriantly clothed with well developed specimens of Tree Ferns in variety, with water below. The house terminates in a cave-like continuation, which is devoted to Todeas, T. superba and T. pellucida being the principal species; and the spaces surrounding the plants are clothed with masses of seedlings. Here the Filmy Ferns have been planted for only about two years, and were simply turned out of 3-inch pots and perched on the sandstone craggy projections of the sides of the house, very little soil being considered desirable. W. S.

THE WEATHER IN SCOTLAND.

An Aberdeenshire correspondent writes under date, Saturday, 26 May:—"The feature of the week, from a meteorological point of view, was the very severe thunderstorm that passed over a large part of the country in the opening days of this week. In the North, fortunately, no human life was lost, but several animals fell victims to the lightning—a fact which illustrates the dangerous nature of the storm in this part of the country. The heat that has been experienced for some time past has given an immense impetus to vegetation. The trees are now almost in full foliage, the fruit bushes are showing abundance of fruit, and garden produce generally is thriving very well indeed. The work of the farm is now well in hand, and farmers are busy laying down the Turnip crop. The weather has now become cloudy, and much colder than on the previous day, but the general run of fine weather has to some extent dissipated the fears that the crops would be prejudicially affected.

TREE PLANTING ON THE EARL OF FIFE'S BRAEMAR ESTATES.

The enclosing of a very considerable area of hill ground on the Earl of Fife's Braemar (Aberdeenshire) estates for the purpose of being planted has just been completed under the direction of Mr. James Gray, his lordship's overseer at Mar Lodge. It should be mentioned that the ground so treated lies beyond the Linn o' Dee, on the south side of the river, extending westwards in the direction of Dalvarar. Between the Linn o' Dee and the village of Inverey his lordship also planted and enclosed a very extensive stretch of hill ground a few years ago, and this new extension is in a sense a continuation of the forest. It is now too late to have the plants put into the new park, but these, largely consisting of Larches, Scotch Firs, and Spruces, will have attention at the close of autumn. W. K.

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JUNE 9. (AVERAGE OF FORTY-FOUR YEARS.)

June 3	58°·8	June 7	59°·7
„ 4	59°·2	„ 8	59°·9
„ 5	59°·4	„ 9	60°·0
„ 6	59°·6	Mean for the week	59°·5

THE PAST WEEK.

The following summary record of the weather for the week ending May 28, is furnished from the Meteorological Office:—

"The weather has been fine and dry in all parts of the kingdom, and the sky generally free from cloud.

"The temperature has been from 2° to 4° below the mean in the 'Wheat producing' districts, but rather above in most of the 'grazing' districts. The highest of the maxima, which were recorded either on the 23rd or 24th, varied from 66° in the 'Channel Islands' to 74° in 'Scotland, W.,' 'England, S.W.,' and 'Ireland, N.' The lowest of the minima were generally registered on the 27th or 28th, when the thermometer fell to between 27° to 34° in Scotland, 37° and 38° in Ireland, and 31° and 36° over

England. At most of the inland stations some sharp ground frosts were experienced. The low average in the 'Wheat producing' districts was chiefly due to the prevalence of very cold nights, the daily maxima in many cases being rather high for the season.

The rainfall has been almost entirely absent over England, but some very slight falls have occurred in Ireland and Scotland.

"Bright sunshine shows a very general and decided increase, the percentage of the possible amount of duration ranging from 41 to 55 in the eastern and northern districts, and from 56 to 72 in the western and south-western."

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

"G. M. W.," Poona, India, writes as follows:—"Many years ago I found the following lines in my memory, but the source from which they had been derived completely forgotten. Perhaps some readers

of your far-reaching journal may be able to identify them:—

"Gardening, man's primeval work,
Is a most blessed toil;
It cheers a man,
Makes him kind-hearted, social, genial,
Forms a serene parenthesis from care,
And his whole nature raises and improves."

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

INSECTS.—*Camjee*: The moth is the well-known Puss moth (*Cerura vinula*). Its caterpillar had no connection with the piece of gnawed wood sent. I. O. W.—*E. L.* The two wild bees sent are the burying *Andrena nitida*. They make their solitary nests—not combs—on grass plots underground. Use lime-water and soap-suds, or gas tar-water, to dislodge them. I. O. W.

MILDEW ON VINES: *Mildew*. The attack is not due certainly to the pig manure-water you employed, but to your keeping the temperature several degrees too low with much moisture, and a stagnant state of the air within the house. Give no front ventilation; and syringe with sulphide of potassium in the proportion of ½ oz. to a gallon of rain water.

NAMES OF PLANTS: *R. Greenfield*. The larger flower is *Phycocactus multiflorus*; the smaller *P. Jenkinsoni*.—*E. H. C.* *Odontoglossum luteo-purpureum scepterum*.—*T. H.* *Odontoglossum Andersonianum*, an attractive sparsely spotted variety.—*J. F. W.* *Aerides japonicum*.—*K. S. L.* *Ornithogalum arabicum*.—*J. B.* 2, *Eriurus alpinus*.—*F. I.* *Mesembryanthemum muricatum*; 2, *Fuchsia splendens*.—*J. T. B.* *Viburnum Awafukii*.—*H. T.* 2, *Alonosa Warscewiczii*; 3, *Festuca ovina glauca*; 4, *Stachys lanata*; 5, *Staphylea colchica*.—*J. T. S.* 1, *Prunus Padus*; 2, *Zephyranthes carinata*.—*A. M. A.* 1, *Cattleya gigas*; 2, *Cedrus atlantica*; 3, next week; 4, *Abies Pinsapo*; 5, *Hippophae rhamnoides*; 6, 7, 8, next week; 9, *Eupatorium Weimannianum*.—*N. O. P.*, *Pontypool*. Probably *Blechnum brasiliense*, but we cannot be certain, without fertile fronds.—*W. M.* *Spiraea hypericifolia*.

NOTICE TO QUIT SERVICE: *F. P.* If the hiring of a domestic servant be general, without any particular time mentioned, the law construes the hiring to be for a year; and in that case a quarter's warning must be given prior to the expiration of the term; but this refers chiefly to servants in husbandry. If no special contract be made, a domestic servant is entitled to a month's warning or a month's wages in lieu of it.

PEACH TREES: *J. Peacock*. The leaves are "blistered" by cold, and they then become the hiding-places of aphides, &c. Cut the injured leaves clean away, and burn them—there is no remedy. Another year protect your trees from cold as much as you can by means of canvas, nets three or four fold, and Frigi Domino.

SEEDS OF CAPE PLANTS: *T. Taylor*. With good treatment the *Begonia* might be got to flower under two years. The yellow *Iris*, which must be kept very moist after sowing, would not flower in less than two years, and it might be still longer before doing so; Water Melons would bear fruit the first season; Citrons would take many years before they fruited, unless parts of seedling plants were worked on old plants of bearing age.

TWIN-FLOWERED LILUM: *C. F. Wood*. The appearance is not uncommon, and is caused by two flowers uniting when in a very young state.

TRICULARIA MONTANA: *J. C. E.* This is a native of New Grenada, and does best in the stove. *Dendrobium chrysanthum* will grow best in a basket

suspended near the roof. Give it decided periods of rest, and you may then succeed with it.

CATALOGUES RECEIVED.

- CLARK BROTHERS & Co., 65, Scotch Street, Carlisle—Summer Flowering Plants.
- THOMAS KENNEDY & Co., Dumfries, N.B.—Florists' Flowers, Pot Roses, &c.
- HOOPER & Co. (LIMITED), Covent Garden—Makart Decorations.

*. Orchid bloom in great variety, but the demand not very good.

SEEDS.

LONDON: May 30.—Messrs. John Sbow & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market, as might be expected, thinly attended, with scarcely any business doing. Quotations all round in consequence remain quite nominal. The growing crops of Clover seeds are unfavourably spoken of. Rape seed continues in favour at the late rise. White Mustard is steady. Boiling Peas realise full rates. In bird-seeds there is no change to be noted. English Buckwheat continues in small supply.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended May 26:—Wheat, 31s. 6d.; Barley, 27s. 10d.; Oats, 16s. 11d. For the corresponding week in 1887:—Wheat, 34s. 6d.; Barley, 25s. 1d.; Oats, 16s. 9d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: May 30.—A sluggish trade for green vegetables, and a stagnant one for Potatoes. Supplies abundant. Prices lower. Quotations:—Asparagus, 1s. 3d. to 1s. 9d. per 100 heads; Cabbages, 2s. 6d. to 5s. per tally; Cauliflowers, 3s. to 5s. do.; Spinach, 9d. to 1s. 6d. per sieve; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 3s. to 4s. do.; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. 6d. to 2s. do.; spring Onions, 1s. 6d. to 2s. do.; Turnip Radishes, 5d. to 8d. do.; Mustard and Cress, 2s. per dozen baskets; Rhubarb, 1s. 6d. to 2s. per dozen bundles; Horse-radish, 10d. to 1s. per bundle; Seakale, 1s. 3d. per punnet; Endive, 4d. to 8d. per dozen; Beetroots, 6d. to 9d. do.; Cabbage Lettuces, 4d. to 6d. do.; Cos Lettuces, 1s. to 2s. per score; English Onions, 6s. to 7s. per cwt.; foreign, do., 4s. to 5s. 6d. per bag of 110 lb.; Carrots, 120s. to 140s. per ton; English Apples, 9s. to 10s. per bushel; American, do., 20s. to 26s. per barrel.

STRATFORD: May 29.—Supply was fair during the week, and a brisk trade was done at the following prices:—Onions, Egyptian, 6s. to 7s. per bag; Apples, American, 18s. to 25s. per barrel; Watercress, 6d. to 8d. per dozen; Radishes, 8d. do.; Lettuce, 1s. to 1s. 6d. per score; Onions, 2s. 6d. to 4s. per dozen; new Carrots, 1s. per bunch; new Turnips, 1s. to 1s. 3d. do.; Cucumbers, 2s. 6d. to 7s. per dozen; Rhubarb, 2s. to 3s. 6d. per dozen bundles.

POTATOS.

BOROUGH AND SPITALFIELDS: May 29.—Stocks of old large, and sales very difficult to effect. Prices irregular and depressed. Quotations:—Regents, 40s. to 85s.; Magoum Bonume, 40s. to 80s.; Duobar, 80s. to 90s.; Champions, 24s. to 100s.; Dutch Rocks, 50s. to 55s. per ton. New: Malta round, 10s. to 11s.; ditto kidney, 14s. to 16s.; Lisbon round, 9s. to 10s. per cwt.

SPITALFIELDS AND COLUMBIA: May 30.—Quotations:—New: Guernsey kidneys, 4d. to 6d. per pound; Malta do., 14s. to 16s.; do., rounds, 9s. 6d. to 11s. per cwt. Old: Presidents, 50s. to 60s.; Imperators, 50s. to 60s.; Regents, 30s. to 35s.; Champions, 30s.; Victorias, 30s. to 40s.; and Magoums, 20s. to 50s. per ton.

STRATFORD: May 29.—Quotations:—Old: Scotch Regents, 50s. to 70s.; do. Magoums, 50s. to 75s.; English do., 45s. to 70s.; and fenlands, 30s. to 50s. per ton. New: kidneys, 12s. to 16s.; Lisbons, 9s. to 10s.; Malts, 9s. to 11s. per cwt.

Imports.—The imports into London last week consisted of 1628 half-boxes, 3550 half-barrels, 3684 packages, from Lisbon; 546 cases, 1899 packages, 151 casks, 228 boxes from Malta; 2 baskets from Bordeaux, 229 bags from Harlingen.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 84s. 6d. to 102s. 6d.; inferior, 74s. to 82s.; mixture, 75s. to 95s.; hay, prime, 84s. to 100s.; inferior, 72s. to 84s.; and straw, 30s. to 48s. per load.

**“ARCHIMEDEAN”
AMERICAN LAWN MOWERS.**

AWARDED
HIGHEST PRIZE
AT THE
Paris Exhibition, 1878;
and the JURY, in their REPORT,
say:—
“The ‘ARCHIMEDEAN’ did the
BEST WORK of any Lawn
Mower exhibited.”
ALSO AT
Sydney Exhibition, 1879-80
AND AT
Melbourne Exhibition, '80-1

Opinions of the Press:
“Far superior to any of ours.”—
Vide *The Field*.
“Remarkably easy to work.”—
Vide *Gardeners' Magazine*.
“The quickest, most simple, and
most efficient mower ever used.”—
Vide *Gardeners' Chronicle*.
“We feel bound to recommend it to
our readers as one of the best mowers
we have as yet made acquaintance
with.”—Vide *Floral World*.

**PRICES FROM
25s.**

Delivered CARRIAGE Free to all Railway
Stations in Great Britain.

WILLIAMS & CO. (Limited), Manufacturers and Patentees.

SELLING AGENTS: **J. G. ROLLINS & CO. (LIMITED),** AMERICAN MERCHANTS,
OLD SWAN WHARF, LONDON, E.C.

NATIVE GUANO.—Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt. A 1 cwt. sample bag sent, carriage paid, to any Station in England on receipt of P.O. for 5s.

Extracts from *Twelfth Annual Collection of Reports*:—
NATIVE GUANO FOR POTATOS, VEGETABLES, VINES, and FRUIT.—G. COUSINS, Walton-on-Thames. “Used for Potatoes. Result: very excellent crop; remarkable size and good quality. Can highly recommend it.”
D. WILLIAMS, Head Gardener to Rt. Hon. Lord Wimborne, Canford Gardens, Wimborne. “Used for Vines, Peaches, Strawberries, flowering plants, kitchen garden crops, with very good results. First-class manure for pot Strawberries.”

NATIVE GUANO FOR ROSES, &c.—T. ST. CLAIR, Rose grower by appt. to H.R.H. the Princess of Wales, Strawberry Hill. “Used for standard and dwarf Roses. Result: excellent growth, fine bloom, and perfectly free from blight the whole season.”
A. F. BARRON, Royal Horticultural Soc., Chiswick. “Without doubt a very valuable manure, and easy of application.”

Orders to the **NATIVE GUANO CO., Limited**, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials may be obtained. Agents Wanted.

**FOWLER'S
LAWN
SAND.**

MANY years' experience has proved this article the most certain and efficacious remedy for the destruction of Daisies and Weeds on Lawns. If used according to the directions it cannot fail to produce a healthy and luxuriant growth of Grass in one application, and to enable the article to be in more general use it is now offered at the following

Reduced Prices.

Viz.: Tins, 1s., 2s., 6d., 5s.; and in Kegs, 4 cwt 8s. 6d.; 3 cwt., 16s.; 1 cwt., 20s.

Sold by all Nursery and Seedsmen.

Sole Manufacturers:

SOWERBY'S ENGLISH BOTANY.

Containing a Description and Life-sized Coloured Drawing of every British Plant. Edited and brought up to the Present Standard of Scientific Knowledge by the late

J. T. BOSWELL, LL.D., F.L.S., & C.

THE FIGURES BY

J. E. SOWERBY, J. W. SALTER, A.L.S., and N. E. BROWN.

Third Edition, in 12 vols., super-royal 8vo, £24 3s., in cloth, £26 11s. in half-morocco, and £30 9s. whole morocco.

Also 89 Parts, 5s. each, except the Index Part, 7s. 6d.

The Work has for nearly a century been the chief authority on English Botany, and in its present form may fairly be taken as the most complete representative of the present state of knowledge of British Plants.

LONDON: GEORGE BELL AND SONS, York Street, Covent Garden, W.C.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally "magical." We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 58 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

POPULAR GARDENING BOOKS.

By far the most widely read on the subject, full of soundest
and best information, Mr. Ryder's writings have been praised
by every Gardening Paper. The books are practical, interest-
ing, reliable, and please all readers.

How to Grow Roses in the Garden and in Pots under glass.
Chapters on Budding, Grafting, &c., &c. Post-free, 7d.

How to Grow Tuberous Begonias. Chapters on Raising
Seed and every other part of culture. A new and thoroughly
revised edition. Post-free, 7d.

Every Amateur and every Gardener as well should read these
books. Only to be obtained from

RYDER AND SON, Seed Merchants, Sale, Manchester.

Estate Sales.

The best County medium for Advertising Sales of
Estates is

THE WORCESTER HERALD, the largest
and leading County paper. Extensive circulation among
the upper and middle classes in Worcestershire and adjoining
counties. Advertisers would do well to forward for reference
and distribution, plans and particulars of Estates, Catalogues
of Machinery, Furniture, Books, and other property advertised
in the columns of the *Worcester Herald*. Specimen copies sent
free. Published Friday for Saturday, price 2d.
Offices, 72, High Street, Worcester.

Sales of Stock and Agricultural Effects.

THE WORCESTER HERALD is the most
effective organ for giving publicity to announcements of
this class. It is the largest and leading Agricultural paper in
the county, and circulates most extensively among Agricul-
turalists in and around Worcestershire. Specimen copies free.
Published Friday for Saturday, price 2d.
Offices, 72, High Street, Worcester.

Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms
to Let, would do well to Advertise in

THE WORCESTER HERALD, the Largest
and Leading County Paper. Specially adapted for
bringing such notices before Tenant Farmers. Large Circula-
tion, moderate charge. Specimen free. Price 2d. Published
Friday for Saturday.
Offices, 72, High Street, Worcester.

TO CAPITALISTS.

A NURSERYMAN, with an OLD-ESTAB-
LISHED FIRST-CLASS BUSINESS,

IS IN WANT OF £3000 to £5000,

to further Develop a Largely Increasing
Business.—Address, in first instance, Box 32,
Gardeners' Chronicle Office, 41, Wellington
Street, Strand, London, W.C.

WANTED, AT ONCE, a good GARDENER
—good all round. A good Plant Grower (but not
Hothouse Plants, only Intermediate). Active and indus-
trious. A Churchman. One who has only been Second need
not apply. Wages, £1 per week, and cottage. Wife attends
the Gate. Help half the day.—Mrs. EVERARD, Fulney
House, Spalding.

WANTED, a married Man, as GARDENER,
or General Outdoor Servant. Good character indispen-
sable. Good wages and comfortable house.—C. EMPSON,
Esq., Beechwood, near Somerley Bridge.

AND SONS, Seed Merchants, Leicester.

WANTED, at the end of June, a very trust-
worthy, efficient married COUPLE. Man to look
after two or three Cows, Pigs, and Poultry; Wife to be a
good Butter Maker. Wages 23s. a week, with a three-roomed
cottage.—Apply, by letter, stating age and last situation, to
Miss SULIVAN, Broom House, Fulham, W.

WANTED, a COWMAN, to attend to eight
Cows and Poultry. Wife to attend to Lodge Gates
and keep front steps clean. Ages between 30 and 40. Accom-
modation not sufficient for more than two children.—Apply,
by letter only, with particulars of former situations, and
wages required, to S. T. FISHER, Esq., The Grove, Streatham,
London, S.W.

GARDENING APPOINTMENT.

MR. JAMES CAROLAN, of the conservatory and
decorating department, Trafford Park, Man-
chester, has been appointed Head Gardener to
the Hon. C. B. BELLEVUE, Barmeth Castle, Dun-
leer, Ireland.

WANT PLACES.

To Noblemen and Gentlemen requiring Land Agents,
STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all
times upon their Register reliable and competent MEN,
several of whom are personally well known to Messrs. Carter.
Enquiries should be made to 237 and 238, High Holborn, W.C.

WANTED, A GARDENER!!!—Having
had long experience and an extensive connection we
are in a position to RECOMMEND MEN thoroughly capable
of filling with credit any situation in the Gardening World.
On receipt of full particulars we will recommend a suitable
Man. Correspondence invited.—R. B. LAIRD AND SONS,
Successors to Downie & Laird, Seed Merchants, Edinburgh.

RICHARD SMITH AND CO.
beg to announce that they are constantly receiving
applications from Gardeners, seeking situations, and that they
will be able to supply any Lady or Gentleman with particulars,
&c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.
—JOHN DOWNIE (of the late firm of Downie & Laird),
Seedsman, 144, Princes Street, Edinburgh, has at present on
his List a number of SCOTCH GARDENERS, waiting re-
engagements. He will be pleased to supply full particulars
to any Lady, Nobleman, or Gentleman requiring a trustworthy
and competent Gardener.

ORCHIDS.—A man of first-class qualifications
and character is at liberty to engage with a Gentleman
to take Charge of a Collection of Orchids, or combine that with
the other duties of a Gardener. He was a pupil of the late
Mr. Spyers.—H. BURBERRY, Marks Tey, Essex.

GARDENER (HEAD), or where help is given.
—Experienced in Stove and Greenhouse Plants, and
Flower and Kitchen Gardening. Good character.—J. D., 18,
Elthorne Road, Upper Holloway, N.

GARDENER (HEAD), where two or three are
kept.—Age 29, married when settled; three years
Foreman in present situation. Nine years' practical expe-
rience in all branches in previous situation.—For references
apply J. ROSE, Mickleham Downs, Dorking, Surrey.

GARDENER (HEAD)—Age 31; fifteen years'
practical experience in all branches. Five and a half
years in present situation. Good character. Abstainer. Death
of employer cause of leaving.—C. HIGGINS, Wellswood,
Torquay, Devon.

GARDENER (HEAD)—Age 30; thoroughly
experienced in Early and Late Forcing of Fruits, Flowers,
and Vegetables; also Flower and Kitchen Gardens. Excellent
character and testimonials.—THOMAS KEINE, Mr. Cotterell,
Spanish Road Nursery, Wandsworth Common, S.W.

GARDENER (HEAD)—Age 45, married, no
family; practical experience in all branches. Excellent
recommendation.—J. D., 192, Fairbridge Road, Upper Hol-
loway, N.

GARDENER (HEAD); age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Eliot Yorke, Hamble Cliff, Southampton, can with confidence recommend his Foreman, G. Dovey, as above.

GARDENER (HEAD), where two or more are kept.—Age 42; thorough practical knowledge of his profession. Understands Stock and Poultry. Personal character. Will forward twenty-two years' testimonials if required.—N. Mr. James, Bruce Grove, Tottenham, N.

GARDENER (HEAD); age 32.—W. T. SCARTH, Esq., Raby Castle, Darlington, Durham, will be glad to recommend James Tullett, who is at present Foreman at Raby Gardens, to any Lady or Gentleman requiring a thoroughly practical good Gardener. Sixteen years' good experience; nine years General Foreman.

GARDENER (HEAD); age 26.—Mr. WILD-SMITH, Gardener to Visct. Eversley, Heckfield, Winchfield, is desirous of procuring an appointment for a young man, who served him as Foreman over three years, giving complete satisfaction in every department of work. He is full of enthusiasm in respect of his calling, and is a good disciplinarian. No small place accepted.

GARDENER (HEAD WORKING).—Age 35, married; thoroughly experienced; the highest references as to ability and character. Pasture Land and Poultry if required.—COTTON, A. Westrup, Esq., Redhill, Surrey.

GARDENER (HEAD WORKING).—Age 38; eighteen years' practical experience in all branches. Good Chrysanthemum Grower. Good reference.—A. B., 6, Langroyd Road, Upper Tooting, S.W.

GARDENER (HEAD WORKING).—Age 38, married, no encumbrance; good Vine Grower, and all other Fruits, and a first-rate Plant Grower, including Orchids, Kitcher Garden, &c. Excellent character.—F. D., 1, Broome Avenue, Levenshulme, near Manchester.

GARDENER (HEAD WORKING).—Age 30, single at present.—Lord RAGLAN wishes to recommend his late Head Working Gardener. Thoroughly up in all branches. Left from no fault. Six years' good character.—W. S., 17, High Road, Knightsbridge, W.

GARDENER (HEAD WORKING); age 36.—C. MARSHALL, for the last four years Head Gardener at Arbury Hall, Nuneaton, is open to engage with any Lady, Nobleman, or Gentleman, requiring the services of a thorough practical man. Left without fault. Character of the highest order.—M., 3, Albert Terrace, Castle Hill, Ealing, W.

GARDENER (HEAD WORKING), where two or three are kept.—Age 29; thorough knowledge of Gardening in all its branches. Fifteen years' experience, four years in present place. Undeniable testimonials as to character and ability.—WM. MOORE, Allerton Hall Gardens, Gledhow, Leeds.

GARDENER (HEAD WORKING, OF SINGLE-HANDED), Wife as Laundress.—Ages 39 and 42; both experienced in their profession. Six years' good character. Three years' previous.—E. STANFORD, Belmore Hall, Herne Bay, Kent.

GARDENER; age 32.—R. SANDERS, Gardener to A. de Rothschild, Esq., will be pleased to recommend his Foreman, A. French, to any Lady or Gentleman requiring a Gardener. Over six years in present place as Foreman.—Hulton Gardens, Tring, Herts.

GARDENER and Wife require situation.—Middle-aged, no family. Man good Working Gardener. Wife (from West of England) good Cook and Dairy-woman. First-class testimonials.—B. M., Mr. Maurice Young, The Nurseries, Milford, Surrey.

GARDENER (SINGLE-HANDED), of otherwise.—Age 41, married, with family; good working. Twenty-one years in last situation. Good reference.—HEAD GARDENER, Westbury Park, Petersfield, Hants.

GARDENER (SINGLE-HANDED), or where labourer is kept.—Age 31, married, no family; Cucumbers, Melons, Tomatos, Vines, Stove, Greenhouse, kitchen, Flower and Pleasure Gardens; good at Chrysanthemums, Primulas, and Winter-flowering Soft-wooded Plants.—GARDENER, Donnington, Willesden, N.W.

GARDENER (SECOND OF SINGLE-HANDED).—Age 24, married; understands Vines, Peaches, Melons, Stove and Greenhouse Plants, Thorough good character. Abstainer.—M., Woldhurst Lodge, Crawley, Sussex.

GARDENER (SECOND).—Age 25; good references.—J. GRAY, The Lodge, Wellington House, Leyland, Preston.

GARDENER (SECOND), where three or more are kept.—Age 23; six years' experience; two years character.—H. THOMAS, 6, Farm Villas, Dalling Road, Hammersmith, W.

GARDENER (SECOND), in a Gentleman's Garden.—Age 24; House Work, or partially in and Out. Understands Stove and Greenhouse Plants, and Flower and Kitchen Gardening. Eight years' thorough good character from present situation.—J. M. D., 22, Church Road, Wimbledon, Surrey.

GARDENER (UNDER, OF SINGLE-HANDED).—Age 20; five and a half years' experience. Good character. Total abstainer.—C. KURN, Crownpits, Godalming, Surrey.

GARDENER (UNDER, OF SINGLE-HANDED).—Age 22; eighteen months' good character from last situation.—E. NAYLOR, 8, Shakespeare Street, Long Eaton, Derbyshire.

GARDENER (UNDER), or SECOND, in the Houses.—Age 21; seven years' experience, Indoors and Out. Good reference.—S. SALMON, The Gardens, Old Dalby Hall, Melton Mowbray.

GARDENER (UNDER, SECOND, OF THIRD); age 18.—Principal of Cuddesdon College highly recommends young man with three years' excellent character.—PRINCIPAL, Cuddesdon, Oxford.

GARDENER (UNDER, or good THIRD).—Age 21; seven years' experience, Inside and Out. Two and a half years' character.—A., Mr. Hill, Park Place, Ham, Surrey.

GARDENER (UNDER).—Age 23; good experience in all branches. Five years with present employer. Good character.—A. WELCH, 7, Stanhope Road, North Finchley, N.

GARDENER (UNDER); age 21.—A GENTLEMAN can highly recommend a thorough energetic young man, of excellent character. Total abstainer.—C. SMITH, Northcourt, Hampstead, N.W.

GARDENER (UNDER).—Age 22; strong and active; six years in last place. Inside and Out. Abstainer.—G. CHANNELL, Hershham, Walton-on-Thames, Surrey.

COWMAN, or UNDER GARDENER.—Understands the Management of Stock. Nine years' good character. Wife could attend to a Lodge Gate.—F. S., Woodmanscot, Lyndhurst Gardens, Hampstead, N.W.

FOREMAN.—Well up in Mansion Decoration and all branches of Gardening. Good reference from last and previous employers.—C. B., 70, Cale Street, Chelsea, S.W.

Well up in Wreaths and Bouquets.—FOREMAN, 30, Moorland Road, Kingston, Port-mouth.

PROPAGATOR and GROWER of Soft-wooded Plants, Ferns, Palms, and Cut Flowers. Fourteen years' experience in Growing for Covent Garden.—J. S., 12, Fountain Grove, Kirkstall, Leeds.

PROPAGATOR or GROWER.—Age 30; Roses, Ferns, general Market Stuff, and Cut Flowers. Twelve years with Market Growers.—EDWARD, 75, Palace Road, Bromley, Kent.

PROPAGATOR.—Five years' experience in Rhododendrons, Conifers, Clematis, Roses, and other Hard and Soft-wooded Plants. Good references.—BRIGGS, Messrs. Cripps & Son, Nurseries, Tunbridge Wells.

JOURNEYMAN, in a good establishment.—Age 21; three years in present situation.—J. MAIDEN, 13, Gorton Street, Heywood, Lancashire.

JOURNEYMAN, in the Houses.—Age 18; four years' character from present situation. Total abstainer.—C. W., 27, Formosa Street, Paddington, W.

JOURNEYMAN, in the Houses; age 21.—W. KEMP, Gardener to Lord Hindlip, can confidently recommend as above.—Doveridge Hall, near Derby.

JOURNEYMAN, in the Houses.—Age 19; five years in last situation. Good references.—FRED. SUMNER, Ranceby, Sleaford, Lincolnshire.

JOURNEYMAN, Indoors, in a good establishment.—Five years' experience. Good references. Two and a half years in present situation.—C. B., 2, Cumberland Place, Kew.

JOURNEYMAN, in the Houses.—Age 17; two years' good character from last situation.—T. D., King John's Farm, Sutton Bridge, Wisbech.

JOURNEYMAN, in a private establishment.—Age 20; four and a half years' experience. Well recommended.—J. W., 53, Upper Park Road, Hampstead, N.W.

JOURNEYMAN, in the Houses, in a good establishment; age 22.—Mr. WARD, Stoke Edith Gardens, Hereford, will be pleased to recommend a young man as above.

JOURNEYMAN, in the Houses.—Age 21; six years' experience in the Stove and Greenhouse and Fruit Houses. Good references.—A. MILLAR, Lealands Cottage, Groombridge, near Tunbridge Wells.

JOURNEYMAN, in the Houses.—Age 20; energetic and obliging. Four years' experience Inside and Out. Good character.—A. COBBOLD, Woodland Cottage, Vanbrugh Hill, Blackheath, S.E.

JOURNEYMAN, or SECOND, Inside or Out, where three or four are kept.—Age 23; three years' excellent character from last employer.—H. BURBOUGH, Bradfield, Reading.

IMPROVER, in the Houses.—Age 20; five years' experience Inside and Out.—Good character.—W. MILES, The Gardens, Queenswood, Heddington, near Cropton.

IMPROVER.—Age 19; five years in present situation in Houses. Leaving by own desire. On gentleman's estate preferred.—C. CANDLER, 167, Lyham Road, Brixton Hill, S.W.

IMPROVER, in the Houses.—Age 18; four years' experience Inside and Out. Excellent reference.—THOMAS DODDS, Packington, Ashby-de-la-Zouch, Leicestershire.

IMPROVER, in a good Gentleman's Garden; aged 19.—J. BATCHELOR, Gardener, Trinity Vicarage, Hyde, Isle of Wight, would be pleased to recommend a strong, active young man. Three years' experience.

To Nurserymen.

KNIFE MAN.—Young; has had good experience in Outdoor Nursery Work.—HORTUS, No. 3, Barcham, near Warmistur, Wilts.

TO NURSERYMEN.—Wanted, Situation in Nursery, Inside. Eleven years' experience with large firms. Able to take charge. Excellent references. Age 24.—C. COLLYER, Staffords Lake, Bisle, near Woking, Surrey.

TO NURSERYMEN.—Wanted, a Situation in the Houses. Nearly six years' experience, and used to the general Nursery Work, Age 21.—J. A., Hamilton Nursery, Commercial Road, Southampton.

TO GARDENERS, &c.—Situation wanted by a Lad (age 16). Understands Plain Gardening. No objection to pony. Well recommended. Indoors.—E. JACOBS, Mile Green, Ingatestone, Essex.

TO GARDENERS, &c.—A young man (age 22), knowing his trade very well, wants employment on a Flower Garden or Country Seat.—Offers to J., J. P. Nobels, Jun., Advertising Office, Naussauaan 13, Haarlem, Holland.

Florists and Plantsmen.

SALESMAN.—Understands Growing Plants, Ferns, Vines, Peaches, &c. References.—J. GREEN, 215, Monument Road, Birmingham.

MANAGER, of a Retail Seed Establishment.—Long experience.—G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WAREHOUSE MANAGER or HEAD SHOPMAN.—Sixteen years' thorough practical knowledge in all branches. Highest references.—ALPHA, *Gardeners' Chronicle* Office, 41, Wellington Street, W.C.

TO THE NURSERY TRADE.—Mr. J. BESTER who is an experienced Traveller, is desirous of representing a Wholesale Firm in the Nursery Trade.—St. Auhans, Portslade, Sussex.

TRAVELLER.—Clever young man will shortly be disengaged. Knows best part of kingdom. Could introduce business. Over twelve years' experience in all branches.—W. B., 24, Terrace Road, Handsworth, Birmingham.

To Nurserymen and Seedsmen.

CLERK.—Age 28, trustworthy, experienced, seeks re-employment; knowledge of Plants and Seeds; has specialised Botany; some outdoor experience. Satisfactory references.—Z., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS.—Wanted, by a thoroughly experienced young Lady, a situation in a First-class Florist's Business.—Apply, stating terms, to FLORIST, 15, Short Wyre Street, Colchester.

HOLLOWAY'S PILLS.—Weary of Life.—Disarrangement of the liver is one of the most efficient causes of dangerous disease, and the most prolific source of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magically in dispelling low spirits, and repelling the covert attacks made on the nerves by excessive heat, impure atmosphere, over-indulgence, or exhaustion excitement. The most shattered constitution may derive benefit from Holloway's Pills, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills and explicitly putting them into practice, the most desponding will soon feel confident of a perfect recovery.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGANS,
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWERS, with Improved Steel Chains and Handles.

SINGLE-HANDED LAWN MOWER.

To cut	can be worked by	Price.
6 inches	a Lady	£1 15 0

SALES BY AUCTION.

The Downside Collection of Orchids. PRELIMINARY NOTICE.

HIGHLY IMPORTANT EIGHT DAYS' SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Wm. Lee, Esq. (who is Selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL by AUCTION, on the Premises, Downside, Leatherhead, about 1 mile from either of the Leatherhead Railway Stations,

On TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 10, 11, 12, and 13, 1888;

and also on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 24, 25, 26, and 27, 1888.

at half-past 12 o'clock precisely each day, the whole of this most valuable Collection of ESTABLISHED ORCHIDS.

Amongst the CATTLEYA TRIANE section (mostly fine specimens) will be found—

- Cattleya Triane Lecana, 4 plants of this superb variety.
C. Triane Victoria Regina

Maxillaria Sanderiana, five plants (one in flower)
Cypripedium Wallisi, two
Cymbidium Wallisi, 3 plants
Saccolabium Heathii
" Harrisianum or gigant-plant
" em album
Messrs. P. & M. desire to mention that no plants will be sold privately, but that the whole will be submitted to public competition.

The collection may be viewed any day prior to the Sale, by cards, to be obtained of Messrs. PROTHEROE AND MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C. The Catalogue is in hand and will shortly be published. Copies can be obtained on application to the Auctioneers.

Tuesday Next.

CATTLEYA MENDELII.
ODONTOGLOSSUM ALEXANDRE.
CATTLEYA SANDERIANA.
ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Shuttleworth Carder & Co., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, June 12, at half-past 12 o'clock precisely, a splendid importation of CATTLEYA MENDELII, in fine masses; ODONTOGLOSSUM ALEXANDRE, of the best type, and in unusually good condition; CATTLEYA SANDERIANA, including several extra fine masses; ODONTOGLOSSUM GRANDE, and other ORCHIDS. The Sale will also include about 150 lots of well-grown ESTABLISHED ORCHIDS, imported DENDROBIUM FORMOSUM GIGANTEUM, ONCIDIUM VARIOSUM ROGERSII, and others.

On view morning of Sale, and Catalogues had.

Friday Next.

One hundred fine varieties of ODONTOGLOSSUM ALEXANDRE in bloom.
Twenty Plants of ODONTOGLOSSUM HARRYANUM in bud. These plants not having previously flowered in this country, some grand varieties may confidently be looked for. Also
CATTLEYA HARDYANA, in flower.

MESSRS. PROTHEROE AND MORRIS will include the above in their SALE by AUCTION on FRIDAY NEXT, June 15, by order of Mr. F. Sauder, together with 4 cases of CATTLEYA MENDELII, received direct for unreserved Sale, and a splendidly blotched hybrid ODONTOGLOSSUM.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 15, at half-past 12 o'clock precisely, a large importation of White LÆLIA ANCEPS, in extraordinary masses and fine condition. The importation contains the varieties SCHRODERIANA, SANDERIANA, SPËLLA, and doubtless other fine forms will from time to time crop up; CYPRIPEDIUM VENUSTUM PARDINUM, just received in finest possible condition, as good as established; AERIDES FIELDINGII, in fine order; CATASETUM BUNGEROTHII and varieties, described in the Gardeners' Chronicle of January 27, 1887, and also figured in Lindena. No collection is perfect without one or more of this valuable novelty. The plants now offered are really good, sound, and healthy, and cannot fail to give satisfaction to buyers. CATTLEYA MOSSIE, just received in very good condition. Also importations of—
Odontoglossum nebulosum
" citrosimum
" maculatum

Carnations, Pinks, and Picotees, from S 311.
The Flower of the Gods!!! (Dianthus: *dios*, divine, and *anthos*, flower).

WILLIAM BAYLOR HARTLAND is offering for Summer Sowings his celebrated strain of the above. His "White Rosette" Glove-scented Carnation is richly perfumed, and snow-white in colour, resembling a "Rosette," and possessing the valuable property of not splitting in the calyx even in the hottest weather, and for buttonhole work and general cutting purposes is unequalled.

CARNATION, Yellow, Bizarre, and Self, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.
.. Yellow, Flake, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.
.. Hartland's White Rosette, Glove-scented, own savings, per packet, 1s.
.. Scarlet Grenadin, or floribunda coccinea, large packet, 2s. 6d.; per packet, 6d.; beautiful.
.. Perpetual, or Tree, for pots, superb, per packet, 1s.

PICOTEES, Yellow and White Grounds, 12 superb varieties, 4s. 6d.; mixed, packet, 1s.
PINK, very choicest, mixed. Some single forms will be found included in this choice strain, and they are very beautiful. Per packet, 1s.
.. Mrs. SINKINS, selected from a lovely non-splitting form of this well-known plant, and own saving, 1s. and 2s. 6d.

. Hartland's Mixed Packets of Gloxinia, Primula, Cineraria, and Calceolaria, are unequalled for quality, 1s. 6d. and 2s. 6d. each.

W. BAYLOR HARTLAND, F.R.H.S., Seedsman, 24, Patrick Street, Cork.

Special Cheap Offer, all Carriage Free,
Of first-class **BEDDING** and **BORDER PLANTS**, &c., for the coming season, by
S. SHEPPERSON, FLORIST, Prospect House, Belper, Derbyshire. The prices are quoted at per dozen or hundred, but persons with small gardens may select smaller quantities without any additional price, but not less than 2s. worth carriage free.

SINGLE DAHLIAS, strong seedlings, from newest varieties, including new whites, to bloom well this summer, 1s. 3d. per dozen; extra strong, 1s. 6d.
CHRYSANTHEMUMS, great special culture, the best and most distinct varieties only of the large-flowered incurved, reflexed, early and late bloomers, Pompona, Japanese, &c., including many grand new varieties by the best English, Continental and American raisers, 12 distinct varieties, named, well-rooted plants, for 2s., 24 for 3s. 6d., free.

CHRYSANTHEMUMS (annuals), Carter's six grand new varieties—Earl Beaconsfield, New Double White, The Queen, New Double Golden, The Sultan, and W. E. Gladstone. Nothing can excel the brilliant beauty of these, and smothered with bloom all summer. Two of each for 1s.

SUNFLOWER, Carter's grand new Double Golden Yellow, 12 for 1s.

FUCHSIAS.—Great special culture of these; 200 varieties, many fine new of 1887, double and single, light and dark, 2s. per dozen, true to name, and well rooted.

TOMATOS.—The three best sorts for amateurs and exhibitors—Carter's Perfection, The Mikado, and Kay's Early Profite. Strong plants, four of each for 1s. 6d.

VERBENAS.—Seedlings from Roemar's new hybrids, far ahead of all others for exhibition and free flowering. Twelve varieties, mixed, for 1s.

And all the following first-class Bedding Annuals, at 2s. 6d. per 100, 50 for 1s. 6d., 500 for 10s., carriage free:—Large flowering imported double **STOCKS**, **CHRYSANTHEMUMS**, and Victoria **ASTERS**, French striped and African Lemon and Orange **MARGOLDS**; finest Scotch varieties **GODETIA**, Lady Satin, Rose, and Duchess of Albany; two grand new varieties **CORNFLOWER**, the new blue; splendid **NASTURTIUM**, tall and dwarf; newest varieties, mixed **DIANTHUS DIADEMATUS**; beautiful white or mixed **EVERLASTINGS**.

S. SHEPPERSON, FLORIST, Prospect House, Belper, Derbyshire.

BEGONIAS A SPECIALTY.—Awarded Four Gold Medals. Quality unsurpassed. Named Singles, from 12s. to 42s. per dozen; unnamed Seedlings, 12s., 18s., and 21s. per dozen; Bedding, choicest, 6s. and 9s. per dozen; choicest named Doubles, from 42s. per dozen; unnamed, very choice, 24s. and 30s. per dozen; choicest mixed, 18s. per dozen. Order direct from us, to procure our splendid strain. The best and cheapest combined procurable. **CATALOGUES gratis.**
JOHN LAING AND SONS, Begonia Growers, Forest Hill, S.E.

Also offering for the first time his new White **VIOLET "SNOWFLAKE,"** at 12s. per dozen. First-class Certificate, Crystal Palace, May 12. Remittance with all orders.

NATIVE GUANO.—Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt. A 1 cwt. sample bag sent, carriage paid, to any Station in England on receipt of P.O. for 5s.

Extracts from *Twelfth Annual Collection of Reports*:—**NATIVE GUANO FOR POTATOS, VEGETABLES, VINES, and FRUIT**.—G. COSSINS, Walton-on-Thames. "Used for Potatoes. Result: very excellent crop; remarkable size and good quality. Can highly recommend it."
D. WILLIAMS, Head Gardener to Rt. Hon. Lord Wimborne, Cauford Gardens, Wimborne. "Used for Vines, Peaches, Strawberries, flowering plants, kitchen garden crops, with very good results. First-class manure for pot Strawberries."

NATIVE GUANO FOR ROSES, &c.—T. ST. CLAIR, Rose grower by appt. to H.R.H. the Princess of Wales, Strawberry Hill. "Used for standard and dwarf Roses. Result: excellent growth, fine bloom, and perfectly free from blight the whole season."
A. F. BARRON, Royal Horticultural Soc., Chiswick. "Without doubt a very valuable manure, and easy of application."

Orders to the **NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C.**, where Pamphlets of Testimonials may be obtained. Agents Wanted.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—
C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

CAPITAL, £50,000, IN 5,000 SHARES OF £10 EACH.
FIRST ISSUE OF 3,000 ORDINARY SHARES.

No payment on application; £2 10s. per Share on allotment. It is not expected that more than £6 per Share will be called up.

DIRECTORS:

Mr. J. COURTENAY LORD, J.P., Birmingham.
Mr. WILLIAM PEARCE, Pershore and Birmingham.
Mr. THOMAS HEWITT, Solihull, near Birmingham.
Mr. R. H. VERTEGANS, Edgbaston, } *Managing Directors.*
Mr. J. F. L. EVANS, Solihull, }

SOLICITORS:

Messrs. J. B. CLARKE AND CO., Waterloo Street, Birmingham.

AUDITORS:

Messrs. SMEDLEY AND SARGANT, 25, Waterloo Street, Birmingham, Chartered Accountants.

BANKERS:

BIRMINGHAM AND MIDLAND BANK, LIMITED, New Street, Birmingham.
Offices: Chad Valley Nurseries, Edgbaston.

This Company is formed for the purposes of acquiring the undermentioned well-known Nurseries, and extending the businesses thereof:—

The Chad Valley Nurseries, Edgbaston.
The Shelley Nurseries, Malvern.
The Royal Nurseries (Hans Niemand & Co.), Edgbaston.
The Solihull Nurseries (Thomas Hewitt & Co.).

CHAD VALLEY NURSERIES.

The Chad Valley Nurseries were established by the present proprietor, Mr. Richard H. Vertegans, F.R.H.S., in the year 1852. Since then he has carried on the business of Nurseryman, Seedsman, and Landscape Gardener, with uninterrupted success. As a Landscape Gardener he has designed and completed successfully for the laying-out of parks, cemeteries, and private grounds, in different parts of the country.

Two new departments have of late years been added to the Chad Valley Nurseries, Alpine and choice Herbaceous Plants, have now become in such request as to constitute a special business. The collection, growth, and propagation of these has been conducted with singular success, and at the present time these Nurseries are of the first rank for the production of these plants. The other department is that of choice novelties in fruits, shrubs, and bulbs, and large quantities of these have been distributed during the past twelve months. More than one thousand new customers have resulted, and in all probability this branch will be greatly increased. A considerable number of novelties, in addition to those already distributed, are in hand, and only need the requisite time for working up a stock before being offered to the public.

In addition to the establishments before mentioned, Mr. Vertegans has a stall in the Birmingham Market Hall (connected by telephone with the Nurseries), from which an extensive and lucrative trade is carried on.

THE SHELLEY NURSERIES.

The Shelley Nurseries, Malvern, consist of about 5 acres of land well stocked with nursery produce, and form a valuable feeder for the Nurseries of Edgbaston.

HANS NIEMAND'S NURSERIES.

The Royal Nurseries, Harborne Road, Edgbaston, have long enjoyed a well-deserved reputation, especially for the growth of decorative plants. They were the only Nurseries at Edgbaston in competition with those at Chad Valley, and the consolidation of the two businesses increases the resources of both whilst diminishing the cost of management, and secures other important advantages.

The Chad Valley and the Royal Nurseries, under separate management, have each long been famous for their resources for decorations for balls, receptions, and parties. The stock of decorative plants at present available for such purposes is very large and important, and far surpasses any other in the Midland Counties. For such plants there is always a considerable demand in Birmingham and the neighbourhood.

The Chad Valley and Royal Nurseries at present cover some 13 acres, upon which there are no less than 40 green and hot-houses, many of large dimensions, and constructed upon the most modern and approved principle.

HEWITT'S NURSERIES, SOLIHULL.

Hewitt's Nurseries are situated adjoining the Solihull Station on the Great Western main line, about 6 miles from Birmingham. They comprise upwards of 9 acres of fertile land, of which nearly an acre and a half are covered by 27 Glasshouses. The Nurseries are approached by a private entrance from the Railway Station, and are admirably laid out. They are well stocked, and in a high state of efficiency. The Greenhouses are of modern construction, and are in good order. Not only have the Nurseries a considerable local trade, but in connection with the business there is a Stall at the Birmingham Market Hall, from which large daily sales are effected.

PURCHASE MONIES.

The purchase monies have been fixed as follows:—

- For the Leasehold Properties, including the commodious Dwelling House, with Seed Shop, Offices, and Conservatories attached, and all the Greenhouses and other erections situated at the Chad Valley Nurseries; and for the Nursery Stock-in-Trade there, and at the Shelley Nurseries, Malvern, and also for the Leasehold Properties and House at 46, Harborne Road, Edgbaston, with the Greenhouses, Plant, Frames, and other erections there, together with the whole of the Nursery Stock-in-Trade, the sum of £10,000, of which £5,000 is payable by the issue to Mr. R. H. Vertegans of fully paid-up Shares in the capital of the Company and £5,000 in cash.
- For the Leasehold Nurseries situated at Solihull, together with the Greenhouses, Trade Erections, and Nursery Stock, and the Goodwill of the business the sum of £9,200, of which £9,000 is payable by the issue to the Vendors, or their nominees, of fully paid-up Shares, and the balance of £200 in cash.

INDEPENDENT VALUATIONS ON BEHALF OF DIRECTORS, MADE APRIL 1888.

These purchase monies were based upon reports previously made by Messrs. George Paul and Hewitt in the case of Mr. Vertegans, and by Mr. F. Perkins, of Leamington, in the case of Messrs. Hewitt & Co. The Directors, however, caused professional valuations to be made on their behalf of both Properties, in order that they might be assured that the purchase monies asked were fair and reasonable. They instructed Messrs. Roderick & Sons, of Temple Row West, to value the Leasehold Properties, Greenhouses, and Erections situated at Edgbaston, to be purchased from Mr. Vertegans, and that firm report their value to be £4,500.

Mr. John Fraser, of Leyton, Essex (a practical nurseryman and professional valuer), who is well known in the trade as a man of large experience, has on their behalf made a detailed valuation of the whole of the Nursery Stock, Plant, Trees, &c., at those Nurseries, and he values the same at £7,097 5s. This gives a total value of £11,597 5s. for the Properties purchased from Mr. Vertegans, for which the Company pay £10,000 without any payment for Goodwill.

Mr. Fraser has also on behalf of the Directors, valued the Greenhouses and Nursery Stock at Solihull, and reports the same to be worth £9,555 11s. 11d., for which the Company pay only £9,200, without any consideration for the Leases, Dwelling House, and Stables on the Nursery, and the Goodwill.

REPORTS OF MR. JOHN FRASER, OF LEYTON.

Mr. Fraser has made reports on all three Nurseries (which may be seen on application to the Solicitors of the Company), from which the following extracts are given:—

"Chad Valley.—Here is an excellently appointed establishment, in which neatness of arrangement and careful attention are combined. The Greenhouses and pits are in good condition,

and, in looking over the stock, the beautiful Lapagerias, both white and red, are remarkable for their good health and vigorous development. . . . Out-of-doors will be found a most choice selection of herbaceous and alpine plants, many of them of great rarity, and all of them in a fine thriving condition. . . . The most notable articles in this place are the collections of new fruits, which are (many of them) only to be found here. These comprise new Raspberries, Blackberries, Apricots, Plums, Apples, Diospyras, and several others.

"The introduction of these fruits displays a most praiseworthy enterprise on the part of the proprietor, and would seem to possess a national importance, giving the owners or tenants of land an opportunity to turn some of it to profitable advantage—this is a most desirable step to advance of the time."

"Hans Niemand's.—Here is a Nursery composed chiefly of glasshouses, which are all in good working order, and contain a large number of plants, such as are used for decorating the large halls and other places of a similar description which are so plentiful in Birmingham. The most extraordinary collection of large Palms is not to be matched in any Nursery in the country. Some of the specimens are of immense size and remarkably healthy, especially when it is taken into account that they have been used for decorating many times. . . . There is as well-grown and healthy a lot of Japanese Maples as can be met with anywhere, and some of the varieties are exceedingly elegant and attractive. Ferns are here in immense quantities, and the same may be said of all the finer and rarer kinds of Dracaenas, Caladiums, Begonias, and many other choice and scarce things, too numerous to mention in a summarised report of this kind."

"Hewitt & Co.—A most notable feature here is the position of this Nursery, situate as it is close to the Solihull Station of the Great Western Railway, from the platform of which there is a convenient entrance. The place is attractive to passengers, and there is no doubt that many customers are secured from this circumstance. The convenience for sending goods at all times to stations on every branch of such an important line as the Great Western is invaluable, and the advantage of the ready communication with Birmingham cannot be overrated. Manure, coal, and other heavy goods are easily obtained, and can be had at the lowest prices. . . . After commenting favourably on the Camellias, Pelargoniums, and Roses, the report says: "Azaleas, Lapagerias, Begonias, Ferns, Palms, Lilies and an immense variety of other useful things help to make up an assortment of good saleable stuff such as is not often met with. Bad cultivation, or worn-out stock is not to be found here. . . . The stock of gold and silver variegated Hollies is such as is not often to be met with; it contains many large and valuable specimens. . . . Greenhouses and hot-water apparatus: these structures are all in good order. Several have been recently erected, and are fitted up with all the improved appliances for ventilating and heating. . . . Tanks are in all the houses, and have an abundant supply of water. The arrangement of boilers and hot-water piping is most efficient, and indicates an accurate knowledge of the requirements of the plants under cultivation."

FUTURE MANAGEMENT.

The management of the business will remain in the hands of Mr. R. H. Vertegans and Mr. J. F. L. Evans (one of the partners of Thomas Hewitt & Co.) Mr. Vertegans' experience in horticultural work has extended over a lifetime, and it would be probably difficult to find a man with a more intimate acquaintance with every branch of the business. The management of the Royal Nurseries is, and has been for the past seven years, in the hands of Mr. Spioks. It is proposed to retain the services of the present staff as far as practicable.

PAST PROFITS.

Mr. Vertegans commenced business in 1852 with practically no capital, and has gradually attained his present position.

Mr. Thomas Hewitt commenced business some forty years ago without capital, and retired in 1884, after having acquired a competency. Since then his business has been carried on successfully by the present vendors, Messrs. Evans & Falcon. In neither case have periodical stocktakings been made, and it is impossible to arrive at an accurate estimate of the profits of the past, but both businesses have grown rapidly, and have always been attended by prosperity.

FUTURE PROFITS.

In view of the terms upon which the properties and stock are acquired, the Directors believe that the profits in the future may be relied upon to produce, after making ample provision for redemption of leaseholds and for depreciation, satisfactory and increasing dividends to the shareholders.

The business is capable of great extension, especially in the direction of the new fruits and other novelties which Mr. Vertegans has recently introduced.

The Cut Flower Trade of the district is at present largely supplied from a distance; during the last few years the demand for Wreaths, Bouquets, Buttoholes, and Flowers for Church and House Decoration has grown enormously and is still growing. With a sufficiency of capital at command there cannot be a doubt but that a much larger quantity of the flowers required for these purposes can be home-grown, at a large profit. There is apparently no limit to the extension of this trade.

The amount of general Nursery Stock required to supply the customers of the business grows larger every year, and as the existing Nurseries are not large enough to supply the present demand, it is in contemplation to secure, either on lease or otherwise, additional land in a suitable locality, where Shrubs, Trees of all kinds, Specialties in Seeds, and Flowers for cutting may be economically grown in large quantities.

Considerable savings will be effected by combining the management of these businesses, and the Directors look forward with great confidence to a successful issue for the undertaking.

Applications for Shares on the accompanying forms may be sent to the Bankers, Solicitor, or Auditors of the Company, and to the Offices, Chad Valley Nurseries, Edgbaston.

The following Contracts have been entered into on behalf of the Company:—

Two Agreements, each dated May 31, 1888—one made between Charles William Falcon and John Frederick Lee Evans, of the one part, and William Thomas Smedley (as Trustee for and on behalf of the Company and of his firm of Smedley & Sargant), of the other part; and the other made between Richard Hartland Vertegans, of the one part, and the said William Thomas Smedley (as Trustee and on behalf as aforesaid), of the other part; but in addition there are or may be various current trade contracts, and applicants for Shares shall be deemed to have waived the publication of the names and dates thereof. Copies of the documents above referred to (other than trade contracts) and the Memoranda and Articles of Association can be inspected at the offices of Messrs. J. B. Clarke & Co., 40, Waterloo Street, Birmingham, and applicants for Shares are to be deemed to have had notice of the contents of all such documents.

PENTSTEMONS.—CLEARANCE SALE.—A charming assortment of the newest and most beautiful varieties. Splendid for the garden, choice named sorts, fine young plants, per doz., 2s. 6d.; 6 for 1s. 6d. Extra choice, per doz., 3s. 6d.; 6 for 2s. Carriage free.

DANIELS BROS., Town Close Nurseries, Norwich.

DAHLIAS.—CLEARANCE SALE.—From our magnificent collection, including all the most beautiful and popular varieties. Show and Fancy, Pompon and Single-flowered, per doz., 4s.; 6 for 2s. 3d.; per 100, 30s. New and extra choice sorts, per doz., 6s.; 6 for 3s. 6d.; per 100, 45s. Cactus-flowered varieties, new and select, including the most beautiful and distinct sorts, per doz., 6s.; 6 for 3s. 6d.; 3 for 2s. All in strong young plants, correctly named. Carriage free.

DANIELS BROS., Town Close Nurseries, Norwich.

CHRYSANTHEMUMS.—CLEARANCE SALE.—A splendid collection, including all the most beautiful and popular varieties, Incurved, Japanese, or Pompon, strong, well-rooted cuttings, correctly named, per doz., 1s. 6d.; per 100, 10s. 6d. Extra choice sorts, per doz., 2s. 6d.; per 100, 15s. Post-free.

DANIELS BROS., Town Close Nurseries, Norwich.

NEW DOUBLE ZONAL PELARGONIUMS.—Splendid, massive, double flowers, of the most brilliant and lovely colours, magnificent for pots. Fine young autumn-struck plants, correctly named, per doz., 2s. 6d.; 6 for 1s. 6d. Extra choice, per doz., 3s. 6d.; 6 for 2s. Carriage free.

DANIELS BROS., Town Close Nurseries, Norwich.

IVY-LEAVED PELARGONIUMS.—Magnificent new double-flowered varieties of the most charming and brilliant colours. Splendid for pots or the garden, fine young plants, well set with flower-buds, correctly named, per doz., 3s. 6d.; 6 for 2s. Extra choice sorts, per doz., 4s. 6d.; 6 for 2s. 6d.; 3 for 1s. 6d. Carriage free.

DANIELS BROS., Town Close Nurseries, Norwich.

PALMS.—A few hundreds, well-grown, strong and healthy. *Seaforthia elegans*, *Lantania borbonica*, *Phoenix reclinata*, 12 inches high, 4s. per dozen, 30s. per 100. Packages and Carriage free.

Lantania borbonica, *Seaforthia elegans*, *Phoenix reclinata*, and *Corypha australis*, 20 to 24 inches high, 1s. 6d. each, 16s. per dozen.

Seaforthia elegans, *Lantania borbonica*, *Phoenix reclinata*, *Enterpe edulis*, and *Arcaea lutescens*, 2 feet 6 inches to 3 feet high, 3s. to 5s. each.

Fine feathery-foliaged *Seaforthia elegans*, 4 feet high, 15s. per pair.

GARDENER, Holly Lodge, Stamford Hill, London, N.

WM. CLIBRAN AND SON'S general Plant CATALOGUE for 1888 is now ready, post-free 3d., also CATALOGUE of the best Vegetable and Flower Seeds.

Herbaceous and Border Flowers.

CARNATIONS and **PICOTEES** to name, 6s. per dozen; **Border and Clove varieties**, from 4s. 6d. per dozen.

DELPHINIUMS, of sorts, unnamed, 4s. per dozen.

IRIS, German varieties, 2s. 6d. and 4s. 6d. per dozen.

English varieties, 1s. and 3s. per dozen.

MIMULUS, or **MONKEY FLOWER**, 3s. per dozen.

PANSIES, Show and Fancy varieties, 3s. per dozen, 25 for 6s., or 21s. per 100.

PEONIES, select herbaceous kinds, 9s. per dozen.

Tree varieties, 2s. 6d. and 3s. 6d. each.

PHLOXES, Herbaceous, of sorts, 2-yrs. 5s. per dozen; 1-yr. old plants, 3s. per dozen, 24 for 6s. 6d., 50 for 12s.

POTENTILLAS of sorts, 5s. per dozen.

PRIMULA SIEBOLDII of sorts, 6s. per dozen.

PINKS of sorts, 3s. 6d. per dozen, 25 for 6s. 6d.

PYRETHRUMS of sorts, strong, roots from the ground, 4s. per dozen, 25s. per 100.

Stove and Greenhouse Plants.

The best Flowering and Ornamental Foliaged kinds, in various sizes, our selections, 9s. per dozen, 50 for 22s. 6d. and 35s.

CALADIUMS, choice kinds, 6s. per dozen.

FERNS, most useful exotic kinds, 12 varieties for 6s., 50 for 21s. and 30s. Small plants for rockwork and fancy pots, 21s. per 100, 3s. per dozen.

The following popular Plants, to bloom this Summer:—

ABUTILONS, of sorts, 3s. per dozen.

ACHIMENES, 12 corms, distinct sorts, for 2s.; 12 sorts, 6 corms of each, for 6s.

BOUARDIAS, grand sorts, 12 for 4s., 50 for 12s. 6d., or 21s. per 100.

CHRYSANTHEMUMS, choicest sorts only, 12 varieties for 2s. 6d., 50 for 10s., or 18s. per 100.

DAHLIAS, to name, 12 plants for 3s., 50 for 10s. 6d., or 18s. per 100.

FUCHSIAS, a charming collection, 12 varieties for 3s., 25 for 5s. 6d., 50 for 10s. 6d.; 100 young plants, out of pots, for 15s.; 12 new Fuchsias of 1887 for 5s.

GERANIUMS, zonals, double-flowering and Ivy-leaved varieties, 12 for 3s. and 4s.; 50, extra choice, for 21s.

GLOXINIAS, 12 choice varieties for 6s., 25 for 10s. 6d.; Seedlings to bloom this year, 3s. per dozen; seed, 6d., 1s. and 1s. 6d. per packet.

HELIOTROPUMS, 12 pretty sorts for 2s. 6d.

LANTANAS, distinct varieties, 2s. 6d. per dozen.

PELARGONIUMS, choicest sorts, 12 varieties for 6s. and 9s.; 12 extra good 12s. and 18s.

ROSES in pots, finest Noisette and Tea-scented kinds, for forcing and indoor decorations, 15s. and 18s. per dozen.

SALVIAS and **TROPEOLUMS**, finest sorts, 2s. 6d. per dozen.

See **GENERAL CATALOGUE** (130 pages), post-free 3d.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 9, 1888.

BOTANIC GARDEN, TENERIFFE.

THIS famous garden is situated midway between the port of Orotava and the "Villa," or upper town. From the lower ground there is a steep ascent the whole way, as it lies on a plateau on the slope of the valley. The garden is about 2 acres in extent, and is said to contain 3000 specimens. It was originally laid out with plants and trees from other zones, with the idea that they might be acclimatised, so as to become capable of growth in countries of considerably higher or lower temperature than those from which they were transplanted. Both money and energy were expended in carrying out the system, and in the latter part of the last century the Marqués de Villeneva del Prado—a resident of Teneriffe—spent large sums and devoted many years of his life to the promotion of the work. On the death of the Marqués the garden languished from lack of funds, and it was let to a private individual, who grew Barley, Wheat, and Potatoes.

In the year 1858 sufficient interest was awakened to cause influence to be brought to bear to obtain a subsidy from the Government for its restoration, when, after further vicissitudes, it became the present botanical garden, renowned for its rare products grown in the open air, and for its collection of the fauna of the Canarian Archipelago. Government, liberal in vote, is lax in award, so that untinted praise is due to the Curator, Herr Wildpret, a Swiss, who, although ill-paid and short-handed, has accomplished great things. His courtesy is continually taxed, and his botanical knowledge called into requisition by visitors. On the occasion of a visit round the garden under his guidance we came away laden with cuttings. Among our store was the white trumpet-flowered *Brugmansia Knightii*—double variety—a favourite plant in the gardens

of Orotava; the *Combretum micropetalum*, in colour and shape like lobster's claws; the *Greyia Sutherlandi*, whose blossoms had merged into red seed-pods, as brilliant as flowers; some curious mottled leaves of the *Ficus Parcelli*; and a bunch of beautiful spotted red leaves—like a Maple touched by frost; a variety of the Castor-oil tree, produced by the Curator's combinations; and other specimens of the wide range of medicinal, edible, and ornamental trees and plants, are too numerous to dream of mentioning, as may be inferred, by the fact, that there are twenty-five varieties of the Banana in these islands alone.

"Here fragrant herbs their odours shed;
Here shoots the healing plant,
With copious fruit the expanded boughs are hung."

The *Eucalyptus globulus*, or Blue Gum tree, was introduced by Mr. Wildpret into the Jardin d'Acclimatisation in 1862, and the newly made *carreteras*—carriage roads—are everywhere being planted with the fast-growing trees. They are of straggling habit, with leaves of a thick leathery texture—quite entire, and very variable in shape. In young plants the leaves are always opposite, but they generally become alternate as the plant gets older, and their stalks then acquire a peculiar twist, so that they present their edges to the branches. The upper leaves are of a distinctly different shade to the under, the top ones being by far the bluer, with a tendency to a tinge of pink. Nevertheless, the effect of the tree individually is rather colourless. The leaves made into a tea are useful in fevers, while a decoction prepared from them has been pronounced by French and Italian physicians, after considerable experiment, to be an excellent substitute for quinine; and they are sometimes bound round the head of a patient, with an advantageous lessening of headache. The timber is exceedingly valuable, but it is yet early for the islanders to grasp the importance of the strength and durability of the wood; nor is it certain that out of the many species—between 100 and 150—the best quality for that purpose has been chosen. The tree is peculiarly adapted for a damp soil, absorbing malarious exhalations, but it thrives well under the system in vogue with arboriculturists in the Canary Isles, *i.e.*, a trench dug round it and daily supplied with water from one of the many channels of irrigation.

The garden boasts some beautiful specimens of *Pinus canariensis*, which is peculiar to the Archipelago, and is a grand and beautiful tree. It has three long spike-like leaves in each cluster, and branches out in great freedom and luxuriance. The wood when cut green preserves anything placed on it, and was used by the aboriginals—the Guanches—to deposit their mummies on in the sepulchral caves. It burns brilliantly when used as a torch. About Lent, many of the trees had undergone a cropping, and had been denuded of their lower feathery branches for religious and church purposes. Some of them are also pruned in, but one tree that a knife had never touched was by far the most elegant in its native amplitude, and its stem looked all the finer for being less heavily scored with the marks that are left when a branch has been removed. [In the present issue we give an illustration of this interesting Pine, see Fig. 94, p. 721.]

The tree of all others that most interests the traveller is *Dracena Draco*, or Dragon Tree of Teneriffe. These are still a conspicuous feature in the scenery of Orotava, and one of great age and repute flourished till recently at Icod, a neighbouring town, about 20 miles to the west.

They are in reality a kind of gigantic *Asparagus*. Foremost among this wonderful type of vegetation stood the famous colossal tree of history and fable, which flourished in the garden of the Marqués de Sauzal at the Upper Orotava. This Brobdignagian was, according to Meyen, 70 feet high and 48 feet in circumference, with an antiquity which must, at least, have been greater than that of the Pyramids. The trunk of the tree was hollow, and contained a staircase in the interior which reached to the height at which it began to branch. Near the ground Le Duc found it to be 79 feet in circumference. Humboldt mentions that when he saw it it had the same colossal size—16 feet in diameter—which it had when the French adventurers, the Béthenourts, conquered these Gardens of the Hesperides in the beginning of the fifteenth century. A tree of such slow growth that for centuries it exhibited but little change naturally aroused the veneration of each succeeding generation. Unfortunately, weakened by inward rotting, it was thrown down by a hurricane that occurred in 1867, and was afterwards completely destroyed by fire. It was figured in the *Gardeners' Chronicle*, p. 765, June 8, 1872. [As we believe our illustration to be the only *authentic* one ever published, we think it may be of interest to reproduce it (see fig. 92, p. 713). It is from a photograph. Ed.] A seedling was planted on the immediate site in 1877, and is now a strong plant of 4 feet high. As it is yet in its infancy it has only a single stem, from the top of which spring a mass of sword-shaped leaves.

Around the wonderful parent tree in connection with the luscious fruited Orange trees was centred much of the romance of the islands.

The *Dracena Draco* of Teneriffe derives its common name from a resinous exudation known in commerce as dragon's blood. The resin has been found in the sepulchral caves of the Guanches, and has hence been supposed to have been used by them in embalming their dead. It appears at one time to have formed a considerable branch of export from the Canaries, and has never wholly fallen into disuse.

That mythology should have encompassed these huge plants is little wonder. Their antiquity, the drops of blood that flowed from a wound, their reputed medicinal properties, the slowness of their growth—it is only after blossoming when of great age that they branch—and their rarity, made them fit subjects for mythic fiction. Though time and progress have swept away much of the romance, they remain still objects of great interest. The Icod tree, next in antiquity to that of the "Villa," formed the occasion for drives and excursions until a storm wrecked that also, and its remains became the prize of relic-hunters, the large portions being made into articles of furniture or ornament, the smaller retained as *souvenirs*, and the oldest tree now extant, likewise at Icod, is visited both by inhabitants and travellers. Viewed dispassionately, they are in no wise beautiful, but curious—very. The leaves, of a glaucous-green colour, sprout upwards from a series of sausage-like stems, and though wondrously diverse in mode of growth, the tree is always symmetrical, and forms a striking feature in any landscape. While ascertained to be indigenous, they are by no means general in the island, and could with advantage be increased in number. There is a good specimen outside the Botanical Garden gates, and in some of the private grounds care has been directed to their cultivation.

The Orange trees still occur in great numbers in the gardens of Orotava; they grow to a good height, and when covered with their blossom and

yellow fruit, are showy and fragrant, but the renowned golden Apples of the Hesperides have dwindled down to a medium-sized, medium-flavoured Orange. Those of finer quality have been allowed to fall out of cultivation, and the inhabitants are fain to import the large luscious species from Grand Canary; but those of Canary are doubtless akin to the golden Apples of fame, and are much appreciated by the visitors. If the name they give them is less poetic than that bestowed upon them by the Greeks, their appreciation is as keen. They eat them before meals, at meals, after meals, in fact at any and every time that the right kind is obtainable.

The glance given at the famed garden has necessarily been cursory. I need only add that it would be a boon to the general visitor, who has but little botanical knowledge, if, by the generosity of the many now making acquaintance with its treasures, more money could be obtained and spent in laying it out, keeping it in order, and labelling the plants. Mr. Wildpret has done wonders; but with a little increase of expenditure it might be made as delightful for the general public as for the scholar and *savant*. *S. Francis Latimer.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × VERVAETIANUM, *n. hyb. Belg.*

Messrs. E. VERVAET & Co. have kindly sent me a peduncle with flower and a leaf of this unique plant, a hybrid between *Cypripedium Lawrenceanum* and *superbiens* (Veitchianum). The leaves are those of the first-mentioned species, but the pallid spaces are uncommonly large, so that they surpass what is usually seen in Sir Trevor's *Cypripedium*. The bract is very short. Peduncle brown with short hairs. The upper sepal is transverse, oblong, apiculate, white, greenish at the base, with twenty-one nerves, brownish purple, greenish at the base. The lower sepals form a narrow body, acute, half as long as the reddish-brown lip that is distinctly angulate on each side. The petals are deflexed, with light purple-brown hairs, and are ciliate at the base, with blackish ocular spots on each side. Staminode forcipate, with an apiculus in the centre, with green reticulations on disc and purple-mauve hairy border. It is dedicated to Mr. E. Vervaeet, whom I have had the satisfaction of knowing for at least thirty years as an enthusiastic lover and grower of plants. *H. G. Rehb. f.*

CYPRIPEDIUM × LEMOINERIANUM, *n. hyb. Gaill.*

At the recent exhibition at Ghent there was a class for "Orchidées nouvelle de Semis." The 1st prize was given to its progenitor, Mons. Raymond Lemoine, of Lille. The plant belongs to that rich group that followed Mr. Seden's *Cypripedium*. If you look over the types of all that crowd, you find that there is not one quite like this one. *Cypripedium leucorrhodum*, which might be regarded as near it, has the petals curved, and *Cypripedium Lemoinerianum* has them deflexed and ascending at the top (half sigmoid).

The plant, duly named in honour of its originator, is most probably the boldest of the whole company. The long leaves are between 2 to 3 inches in breadth, with a very sharp keel on the mid-line underneath. The very strong peduncles are as thick as an eagle's quill (I think 3 feet high), usually branched, brownish-purple, hairy. The bracts are uncommonly large, spathaceous, light green, equal to or surpassing the reddish indian-purple ovary; sepals whitish-yellowish, the combined one very ventricose, all with many purple nerves; lateral edge of the upper one inflexed, purple. All the colours are deeper outside. The petals are descending, but ascending at the apex, with a broad base, then lanceo-acuminate, white on the disc inside, with a purple margin and top. The lip is exceedingly

FIG. 92.—DRACENA DRACO: DRAGON TREE AT TENERIFFE. (SEE P. 712.)

conspicuous, retuso-ventricose, very broad, inflexed, side lobes yellowish-white with purple spots inside, with numerous similar spots on a white ground inside. The sac and inferior side are of fine dark purple. Stamens moderate transverse, whitish-yellow, with a hairy purple margin.

I admired the plant at Ghent, and as is customary with exhibition plants, I felt pretty sure that I should not receive any specimen of it, and hence should be unable to describe it. But now, to my great surprise, I have received glorious materials. They do not, however, come from Mr. Raymond Lemoine, but from Mr. F. Sander—not from Lille, but from St. Albans. What an interesting topic is the wandering of Orchids! *H. G. Rehb. f.*

THE GARDEN AT THE DELL, EGHAM.

BEAUTIFUL at all seasons of the year, but the present is perhaps the best time to see Baron Schroder's garden, which is a most perfect example of well-ordered gardening. Just now the brilliant and extensive display of Rhododendrons, artistically and uniformly planted, gives a rare glow of colour, and which harmonises delightfully with the delicate yellows, coppery-red, and other showy tints of the *Azalea mollis* and *A. pontica*, with the rosy-lilacs and lavenders of the clumps of tree Peonies, and with the clear yellow of the double dwarf Spanish Furze, which is found in the garden in abundance. The beds of Violas, Wallflowers, Forget-me-Nots, and other spring subjects are still in flower, but making place here and there for the summer bedders. The herbaceous and hardy bulbous plant garden is also very showy now, and as it is planted with a view to a permanent display it will continue to be so until the winter comes. Ranunculuses, Anemones, Pyrethrums, Irises, Peonies, &c., make a grand display, and soon that noblest of all hardy bulbous plants, *Crinum Powellii*, will be in even greater beauty than in former years. In frames near at hand it is a pleasing and unusual sight to see a large quantity of Freesias, Sparaxis, Tritonias, Ixias, and other allied plants which are or have been well furnished with bloom—an unusual sight with these plants, which, however, are easily grown and flowered if properly managed; and their rich colours should make them worthy of more attention than they get in most gardens.

Of the glass department it may be said that the Dell seedling *Imantophyllum* have made a grand show. The greenhouses were well filled with bloom, the Nepenthes-house was stocked with vigorous plants, and the numerous fruit and forcing-houses were all in the most promising condition. In the fruit-room it is noteworthy that in bottles in the racks Madresfield Court and other Grapes cut and placed there last Christmas, are plump and perfect as ever.

The new rockery-house, arranged and planted by Messrs. Jas. Veitch & Sons with fine tree and other Ferns, Palms, foliage plants, such as variegated Phormiums and creeping plants of various kinds, adds another good feature to The Dell gardens, and one which, being admirably executed, needs only a little time for new growth to be made by the plants to render it perfect. In such a quiet retreat as this, the sound of running water as here arranged is very grateful to the ear—indeed, a rock-fernery is not complete without it.

THE ORCHIDS.

The large new Cattleya-house just built is now filled with the finest and best *Lælias* and *Cattleyas*, both imported and hybrids, which can be obtained; indeed, the great specimens of *Lælia Amesiana* ×, *L. bella* ×, *L. Sedeni* ×, *L. callistoglossa* ×, *L. flammæa* ×, and other rare hybrid *Cattleyas* and *Lælias* now in the new house, and which have been grown on at The Dell from small plants, would be unpurchasable now at any price. With them in bloom are great masses of *Lælia purpurata*; a grand

variety of *L. ensipathæ*, with five flowers on a spike^e; some good *L. elegans*, many specimens of *Cattleya Mendelii* and *C. Mossii* varieties, of which the distinct *C. Mendelii* Rothschildiana, with wonderfully frilled crimson lip, and something of the look of *C. gigas* about it; the true *C. Reineckiana*, with very large pearly-white flowers; the pure white *C. Mossii* alba, and a fine specimen with the flowers of the pure white and orange *Cattleya Wagneri* superba, are wonderful examples. Some large specimens of *C. Skinneri*, too, were covered with bloom, as were some smaller ones of *C. S. alba*, *C. citrina*, the new *Scuticaria Keyseriana*, some large and well-flowered plants of *Sobralia macrantha*, and a huge specimen of the noble yellow-flowered *Sobralia xantholeuca*, with many large *Cattleya*-like flowers, the whole displaying themselves much better in their more commodious quarters than in the old house. In this new house there is no central stage, but broad side-stages instead, with a wide walk between them, the roof over the walk being hung with plants in baskets, and in that position there is no risk of damaging those on the stages with drip from those hanging overhead—an arrangement which has cost the life of many a valuable plant.

THE COLD HOUSES

have also a fine display. In that devoted to the large *Odontoglossums* is the first bright yellow *Odontoglossum* of the best true form of *O. Alexandra*, with fine shape and substance, and marked profusely with chestnut-brown, differing only from really good *O. crispum guttatum* in having golden-yellow flowers. It seems to be a seedling from a natural hybrid with a yellow ground, which, while reverting in shape to the best form of *O. crispum*, still retained the bright yellow colour acquired through the original cross. Certain it is that some combination of circumstances has produced in it features which have not appeared in *Odontoglossums* in cultivation before. Another good thing is a heavily blotched variety in the way of the priceless *O. crispum apiatum* also located with many of the *élite* of the *Odontoglossum* family at The Dell. Also in flower were many *O. Wilckeanum*, *O. citrosimum*, *O. cordatum*, *O. Gerstedii*, *O. Harryanum*, *O. Cervantesi decorum*, and *O. C. morada*, *O. Hallii*, *Oncidium macranthum*, *Sophrunitis grandiflora*, *Epidendrum vitellinum majus*, *Dendrobium Jamesianum* with some thirty flowers. This last-named Orchid thrives well here in this collection.

Among *Masdevallias* the *M. Harryana* in variety are a gorgeous display of bloom, of which with *M. Veitchiana* continue still to supply the more brilliant colours in the genus. Many *M. ignea*, *M. Schlimii*, *M. macrura*, *M. amabilis striata*, *M. Cheloni* ×, *M. Gareana* ×, and others, were in bloom; while overhead hung baskets of *M. chimæra*, *M. bella*, *M. radiosa*, *M. Houtteana*, and others of that class, some of them with over fifty blooms on them.

The houseful of *Miltonia vexillaria* also made a great show, the pretty white-lipped *M. var. Cobbiana*, and some equally good imported varieties being well furnished with bloom. Of the importations, some plants of Messrs. Shuttleworth, Carder & Co.'s importing far excel all others in the size and beauty of their flowers, while some from other sources have flowers so diminutive that they are cast out as weeds. *M. Roelzii* is also represented by many specimens, and *Oncidium phymatocilium*, *Lycaste Lawrenceana*, *L. Skinneri* alba, *Ceolgyne ochracea*, *C. ocellata*, *C. Massangeana*, *Arpophyllum giganteum*, and some marvellously sturdy plants of *Disa grandiflora*, bore evidence of the highest degree of culture.

THE WARM HOUSES.

Each of these has a fine arrangement of large specimen foliage and flowering plants, *Anthuriums*, *Ixoras*, &c. On the centre staging, and among the Orchids on the sides, were a fine lot of *Aërides* showing bloom; a large specimen of the neat and pretty *A. Ballantinei*, *A. Houletianum*, and of the richly-tinted *A. virens Dayii* being already expanded.

Some *Phalenopsis* also were in flower, some good specimens of *Dendrobium thrysiflorum*, *D. Bensoniæ*, *D. Devonianum*, *D. transparens*, *D. chrysotoxum*, *D. densiflorum*, *Vanda Dennisoni*, *V. teres*, *Angraecum sesquipedale*, *Saccolabium ampullaceum*, *Zygocloax leopardina* ×, *Calanthe Dominiana*, and a very rich collection of large plants of *Cypripediums*, among which was a fine specimen of *C. Fairrieanum*, which, suspended in a basket, in a shady corner of a coolhouse, had leaves almost as large as those of *C. insigne*. Other *Cypripediums*, in bloom or bud, were the grand new *C. bellatulum* of Messrs. Hugh Low & Co., *C. concolor Reguierii*, *C. Godefroye*, *C. Wallisii*, *C. Curtisii*, *C. Morganae*, *C. Schroderæ*, *C. Stonei platyanemum* (almost the whole of the stock of it in cultivation), *C. superciliare*, *C. Lavigatum*, *C. calanthum*, *C. Lawrenceanum*, *C. Harrisianum superbum*, *C. H. nigrum*, *C. grande*, *C. selligerum majus*, *C. Veitchii*, and *Uropedium Lindenii*.

THE ROCK GARDEN.

THYMUS SERPYLLUM var. ATROPURPUREUS.

As to the beauty of this plant I can support all that *C. Briner* says respecting it. It may, however, be as well to state that Messrs. Backhouse & Son possess two varieties of the Mountain Thyme of equal merit but different in colour. *T. serpyllum* var. *atropurpureus* (this is not yet in commerce) and *T. serpyllum* var. *cochinus*, and I think it is this latter plant *Mr. Briner* desires to call attention to, and than which nothing can be more beautiful on the rockery.

SAXIFRAGAS.

Of the *oppositifolia* section of *Saxifraga* several varieties have been selected at the York Nurseries. *S. oppositifolia* var. *pallida* was I believe the first, then *S. o. var. splendens*; these were found by *Mr. Backhouse* in either Wales or Cumberland (I am not sure which locality—possibly in both). After these varieties had been grown and distributed for a few years, an importation from the Pyrenees was received of *S. oppositifolia*, and when these became established they were found to be distinct in foliage, habit, and flowers, and were named *S. o. var. pyrenaica*, to distinguish them from the British plant. Again when *S. o. var. pyrenaica* had been cultivated for a few years and seedlings raised from it, it was found to vary considerably, from which the following varieties were selected:—*S. oppositifolia* var. *pyrenaicarubra*: the flowers of this are about the size of those of *pyrenaica*, but intensely deep in colour; *S. o. var. pyrenaica* var. *maxima* has blossoms very large indeed, which are of a soft rose changing to rosy-pink; *S. o. var. pyrenaica* var. *superba* has good sized flowers, fine in form, and of an intense deep rose in colour. It is to this latter plant *Mr. Briner's* remarks evidently apply. By referring to p. 419, vol. N. S. 21 of this journal an illustration of this latter variety will be found. To grow this latter plant well and successfully it is requisite yearly to scatter amongst the leaves a covering of alpine soil—loam mixed with small stones or gravel. *R. Potter, Holgate, York.*

THE MANUFACTURE OF QUININE IN INDIA.

A RESOLUTION recently issued by the Government of Bengal briefly reviews the history of the introduction of the Cinchonas into India, and traces their development, as well as the manufacture of amorphous quinine, cinchona febrifuge, and, more recently, of quinine itself. The history of all the stages of progress except the last are well known, but the success which has attended this latest experiment deserves to be fully recorded.

On this head the resolution referred to says—alluding to the work of *Mr. Gammie*, the resident manager of the Government Cinchona factory in Sikkim—that he took the matter up with energy,

and, encouraged and assisted by Dr. King, he carried on a long series of experiments on an acid and alkali process of manufacture, by which he succeeded in producing excellent quinine. He never, however, succeeded in recovering much more than half of the amount contained in the bark upon which he operated. The acid and alkali process had, therefore, to be abandoned as wasteful and inefficient. A process depending on the maceration of the bark in spirit was next tried, but after much experiment it was in turn abandoned.

During a visit which he paid to Holland in 1884, Dr. King acquired some hints as to a process of extraction by means of oil; and now, benefiting by the advice of some chemical friends, Mr. Gammie has been able to perfect this process, with the result that the whole of the quinine in yellow bark can be extracted in a form undistinguishable, either chemically or physically, from the best brands of European manufacture. This can be done so cheaply that, as long as the supply of bark is kept up, quinine need never cost Government much more than 25 rupees per pound. It is remarked that the price of quinine in the open market at the present time is not very different from this, but this is stated to be due to entirely exceptional causes. For some time past the Ceylon planters have been uprooting their Cinchona trees, both to save them from disease, and to make way for Tea planting, which appears now to be becoming the principal industry of the island, and Cinchona bark has actually been sold in London below the cost of its production in Ceylon.

It is further notified that "The cordial thanks of Government are due to Dr. King and his coadjutors, and especially to Mr. Gammie, for the patience, energy, and resource displayed by them in their long search for the best method of utilising these valuable medicinal barks. The Government has no desire to make a profit by the discovery, and the details are now produced in order that private growers of Cinchona may be enabled to take full advantage of the process, and that a permanent reduction in the price of quinine may ensue."

THE ALPINE GARDEN.

HABERLEA RHODOPENSIS.

DURING several years I have found this plant far easier to cultivate than its near ally, *Ramondia pyrenaica*. It multiplies its rosettes readily, is easily divided, and grows readily under a sheltered stone on the rockery in a mixture of limestone, gravel, and loam. It dislikes sunshine, but is less liable to be injured by it than the *Ramondia* is. The flowers are more plentiful, but less attractive in their colour and expansion than those of *Ramondia*. Both plants ripen seed plentifully, but the seedlings grow so slowly that they are generally overwhelmed and lost in fungoid growth before they are large enough to be moved. I may add that the flowering of all alpinus this year is most exceptionally good.

LITHOSPERMUM GASTONI AND ADONIS PYRENAICA.

These are two plants each of them remarkable for the narrow limits of the district in which it is found wild, and each of them equally refractory in the hands of most cultivators. First as regards *Adonis pyrenaica* (DC.). It has been imported and sold by nurserymen—though very frequently *A. verna* has been sold for it—for twenty years; but no one can say that he has cultivated it continuously and successfully for many years. I have had many imported plants, which I have tried under many conditions. Sometimes they flower well once or twice, and then disappear altogether. No one who has once seen the plant can mistake *A. verna* for it, although it is often grown under that name. The broad-spreading, bare-stalked foliage of *A. pyrenaica* at once distinguishes it. Still *A. verna*, where it does well, is, I think, quite as good a plant. *A. pyrenaica* is confined to a few valleys in the Central Pyrenees, where it is becoming scarce. Two years ago a correspondent sent me, without my asking for them, a hundred roots, saying that he sent me a good supply, being the last he should send, as plant collectors had

nearly extinguished it! The greater part of these I distributed where I thought they would be well cared for, but I have received hardly one favourable report of its welfare. Out of about fifty planted in different situations and soils in my garden, perhaps half are still alive. Not more than three or four have flowered well this year; and about half-a-dozen look healthy, as if they would reach their climax next year, after which they will probably perish.

Lithospermum Gastoni (Bentham)—named after Gaston Saege, a local botanist of Eaux Bonnes—is a still more interesting plant. Its portrait in *Bot. Mag.*, t. 5926, shows it as very attractive, as no doubt it is on its native rocks, but it does not readily adapt itself to the conditions of an English garden. A plant—I forget whether imported direct, or obtained from a York nursery—has been growing unhappily on my rockery for four or five years; this year—owing, I believe, to the heat and suns of last summer—it has flowered, and looks healthy. Still, for English gardens I do not think it as good a plant as the native *L. purpureo cœruleum*, which has flowered exceptionally well this year, and is, when properly managed, a first-class spring flower. *L. Gastoni* is found wild only on a few steep mountain faces at high elevations in the department of Basses Pyrenees, where I saw it growing, but not in flower, in May, 1886. *C. Wolley Dal.*

SOME SPECIES OF PRIMULA.

PRIMULA villosa var. *nivea* (t. 1161 of *Botanical Magazine*) is the plant alluded to at p. 650. It was at that time (1809) grown in gardens under the name of *P. nivalis*, also as *P. pubescens*. Mr. Dewar, in his synonymic list, places it with *P. viscosa* as a variety *nivea*. As this is the latest authority from Kew, I think it ought to be adopted. [Mr. Dewar now thinks it is *P. pubescens* alba, and in that opinion he is supported by Mr. Churchill and Mr. J. G. Baker, Ed.]

The t. 14 of *Bot. Mag.* is *P. villosa*, now grown in gardens as *P. viscosa*. This figure was taken in 1787, with a statement that the *Primula* in question had been grown for many years in the nursery gardens near London; and as a proof that the white variety was found in the Alps, the editor says, "Mr. Salisbury informs me that a variety of this plant with white flowers, brought originally from the Alps of Switzerland, has for many years been cultivated in a garden in Yorkshire." This white variety is certainly a gem amongst *Primulas*, and is easily cultivated.

Mr. Jenkins will not get a large quantity of seeds from his plants, and the produce cannot all be depended upon to flower like the parent; some of them will produce pink or pale purple flowers. The few seeds the plants produce does not in any way weaken them. Our seedlings flowered very freely this year, and as they were raised some six years ago they are now good specimens, but many of them are of slow growth, and are as diverse in their constitution as they are in colour.

The loveliest *Primula* we now have in flower is *P. Reiddii*. We cannot yet get large plants of this species. The largest might be planted in a tumbler, but they each produce a flower-stem 2–3 inches high, furnished with four to five white flowers 1 inch across. *P. Munroi* is also in flower in the open ground, so also is *P. Parryi*. We have plenty of plants of the latter, but they fall short of the *Botanical Magazine* figure. Each truss is formed of some six or eight reddish flowers with a yellow centre, but it does not form a very showy garden plant. It is sufficiently hardy, and is flowering, both planted out-of-doors and in pots. *P. geraniifolia* is just opening its flowers in the Auricular-house, so that it may be said to be one of the latest spring flowering varieties. The flowers are of a purplish-red colour. *P. sikkimensis* is and has been in flower for more than a month; its clusters of primrose-coloured flowers, each 1 inch across, are very showy. I have just counted eighty-three flowers in one umbel. *P. imperialis* is late, but the lower whorl

of flowers on the stems are opening. The flowers are produced in whorls on tall stems in the manner of *P. japonica*, and are of a rich bright yellow colour; it is a June-flowering variety, but those showing flower have been for some time in heat. *P. verticillata* is yet plentifully in flower as a pot-plant. We could have filled a large garden with our *Primulas* alone this year if the Auriculars are, as they ought to be, included in *Primulas*. *J. Douglas.*

FOREIGN CORRESPONDENCE.

NARCISSUS SULPHUREUS, DOCTOR GORMANN, AND SEMI-PARTITUS.

It seems that there is a difference of opinion as to these three sorts, which we consider different one from the other, and in consequence it may be of some interest to point out the reason why, in the absence of proof to the contrary, we adhere to our opinion. It seems necessary to point this out, as Mr. Hartland, in the *Gardeners' Magazine*, May 16, 1885, says that what is sold by our firm as *N. incomparabilis albus-sulphureus* is called in England Doctor Gormann; and in his *Little Book* of 1886 it is said that Doctor Gormann is *Haworth's Queltia alba*; while Messrs. Barr, in their pamphlet on Daffodils of 1887 say that the name Doctor Gormann is withdrawn until the Daffodil Committee settle which candidate is to have this name.

Firstly, we must observe that in our list as synonymous with *incomparabilis albus-sulphureus* we put the name of Doctor Gormann, but with a mark of interrogation after it, as we accepted the synonym from the English reports, although not persuaded that it was correct to do so. We have now closely examined the different forms belonging to the above sorts, with the following results:—

In the first instance, we think it necessary to say from whence our stock came which gave the flowers for examination. *N. incomparabilis albus-sulphureus* was introduced into our nursery as long ago as 1846 from Whitley & Osborn's collection. We received it from these gentlemen under the name of *Queltia aurantiaca alba*. In later years we found in our double sulphur crowns single forms quite equal to this *Narcissus*. Our Doctor Gormann came from Mr. Peter Barr's collection, from whom we too introduced (partially) our *N. semi-partitus*. As for the double forms, the double sulphur crown is cultivated under that name, or that of Sulphur Phoenix, in Holland for as long as the present generation can remember. We received it about the year 1846 from the Fulham Nursery, under the name of *Queltia concolor sulphurea plena*. The double form of *semi-partitus* originated in our nursery by the gradual change of the single one.

As for the colour of the flowers, that of the single *albus-sulphureus* and Doctor Gormann is quite the same, but there is a great difference between them in the form and size of the perianth and cup, Doctor Gormann having the best form of the two. The cups of both are lemon-yellow, the perianths whitish, at the base slightly tinged yellowish. The cup of *sulphureus* is deeper, and not so much spread out as that of Doctor Gormann, more curled at the margin, and forming stronger folds at the lower part of the incisions; the perianth segments are longer, and not so broad as those of Doctor Gormann, which are finely pointed, oval. Of Doctor Gormann the cup is larger, shorter, and more widely opened.

N. incomparabilis pallidus semi-partitus has a finely formed regular cup, divided into six equal ovate parts; it is widely spreading, and of the same lemon colour as that of the two other sorts, but showing a little lighter as there are no shades from folds. It is equal in depth to that of Doctor Gormann. The perianth segments are spreading, of fine ovate form, and of stronger constitution than those of the two other sorts; they are of a saffron-yellow colour, and quite distinct. Of Doctor Gormann we never saw a double form.

The double form of *N. sulphureus* is well known as

the White Peerless Daffodil or Codlings and Cream. It has full double pompon flowers without any mantle of a whitish colour, the small leaflets being yellowish at the base.

The double form of semi-partitus is quite different. When doubling the single flowers begin to show a few more flower leaves than usual, and when such plants are separately planted they not only remain constant, but their doubling increases every year, the segments being superposed regularly in six rows, thus forming a fine double or triple star in the same way as the doubling of *Narcissus capax* or *Eystetensis*. Whether this doubling will increase must be proved in the future; but even if this be the case, the double flower will never become equal in form to that of the sulphur crown. We suppose, in examining the difference of the cups of the single form of both sorts, there already will be found indications of what the future doubling will be—the wrinkled cup of sulphureus promising a double flower, the more regular cup of semi-partitus divided into six parts indicating the star doubling of the superposed segments. So, if the single form of *N. capax* be ever found, we should think it will prove to have a cup similar to that of the single semi-partitus. *E. II. Krelage, Haarlem.*

Fruits, &c.

A recent report from Baltimore gives some interesting items on the trade of tinning and packing fruits and vegetables for export. The packing-houses of Baltimore, it is stated, can put up 40,000 bushels of Peas, and 100,000 bushels of Tomatos, a day, each bushel being equivalent to thirteen tins. During the past year Maryland and Virginia turned out 968,646 cases of preserved Tomatos of two dozen tins to the case, or a total of 23,217,504 tins, which at the wholesale price of one dollar a dozen 3 lb. tins, represents a sum of 1,937,292 dols.

Another mode of treating fruit which is becoming very popular—and which has, no doubt, a great future in store for it—is by evaporation. This system, however, is more practised in Virginia than in Maryland. While a great saving to the grower, it is a luxury to the consumer, for it is said that fruit thus treated, when cooked or used in pies or tarts, is quite as good as when plucked fresh from the trees.

The Zimmerman Fruit Drying Company, of Cincinnati, manufacture an evaporator at a cost of from 45 dols. to 50 dols., which, besides drying fruit, may be used to bake and roast. It is stated that this implement will bake fifteen loaves of bread and forty pies at a time; that it will roast meat, poultry, and game, to perfection; that it will dry clothes; and when not in use may serve as a meat-safe.

On the subject of Cotton-seed oil, which it is well known has been for some time used as a substitute for Olive oil, the report says:—"Cotton-seed oil has become quite important as an article of food. It is shipped in vast quantities to Spain and Italy, whence it returns to America labelled 'Pure Olive oil'; for adulterating purposes it enters largely into all fatty substances for domestic consumption, such as lard, butter, cheese, &c.; and there is quite an extensive demand for it in the Northern States for the manufacture of 'Pure French Sardines' out of a small local herring!"

ST. BRIGID ANEMONES AT HOME.

MUCH as I had heard of the St. Brigid Anemones as they grow in their windy home at Howth, their beauty, both in form and colour, was a surprise. Any attempt at description must not only be a failure, but will probably seem an exaggeration. Beds of every shade of bright colour, from brilliant scarlet to soft rose, and pale flesh-colour; some flowers with clear white circles round their black centres, others shaded and striped Carnation-fashion. Purples of many shades blend amongst these, and add much to the beauty of the general effect. Even pure white is to be found, and is a singularly beauti-

ful variety, in which the black centre is replaced by one of very light grey. Almost all these Anemones are semi-double, although the few single ones scattered amongst them are by no means the least lovely. Amongst the semi-double kinds there is great variety of form; some with deeply-lobed segments like miniature leaves of Staghorn Fern; others pointed like the petals of a Cactus Dahlia—a flower, indeed, which many of these bright scarlet Anemones strongly resemble. When not in full sunshine, and with the flowers partially closed, their beauty changes, but hardly lessens; the black centres become hidden, and the flowers are quite double, some of them reminding one of double Paeonies, others of Chrysanthemums. This year, amongst these many varieties an entirely new form has appeared, the outer segments being large, quite flat, and deep purple; while round the usual black centre the flower is filled in with very small sepals of a light mauve.

This singular success in Anemone culture is chiefly the result of rigid selection carried on, one might almost say ruthlessly, for many years, the plants pulled up being often quite as good as some of the best amongst ordinary Anemones. Here, however, only the best of the best are allowed to "survive," and the result more than justifies the means, the largest flowers being 5 to 6 inches across.

The soil is a stiff one, well enriched with cow-manure dug in about 6 inches deep. The seedlings are transplanted, or thinned out to at least 6 inches apart. This latter point "St. Brigid" considers of the utmost importance in their culture. The position is sunny, and though much exposed to west and south winds, well sheltered from the north and east. This garden is within a few hundred yards of the sea, but St. Brigid succeeded equally well in growing Anemones in a cold inland county, where, however, the soil was also a stiff loam.

Amongst the many brilliant masses of colour to be found where spring flowers are well grown, I have never seen anything to surpass the beauty of these beds of Anemones on a bright day in May. *C. M. O.*

ORCHID NOTES AND GLEANINGS.

ONCIDIUM SPHEGIFERUM, Lindl.

THE bright orange-coloured flowers of this species render it a particularly showy one, the colour being rather rare in the genus. They are borne in large branching panicles, which have a very brilliant appearance. I do not know if it is as variable in colour as the allied *O. divaricatum*, in which some of the varieties are much more brilliant than others, but the particular piece which has just come into my hands has the sepals and petals deep orange, while the lip is yellow, spotted with brown. It belongs to Lindley's small group *pulvinata*, of which one or two of the species are sometimes confused. The four species of this group are all Brazilian, and distinguished by a small pulvinus, or cushion-like hairy crest on the lip. *O. Harrisonianum* cannot be confused on account of its remarkable crest having five ascending teeth, of which two are longer than the others. The colour is yellow, enlivened with crimson linear markings. *O. divaricatum*, though variable in colour, may be recognised by its distinctly four-lobed cushion, while the lateral lobes of the lip are flat, and the margin entire. The two remaining ones are very closely allied, but in *O. pulvinatum* the cushion is quite circular, while the side-lobes of the lip are crisped, and the middle one very broad; but in *O. sphegiferum*—the subject of the present note—the cushion is somewhat obovately oblong, and the side-lobes serrate or crenulate, but flat. These characters may help to separate these allied forms from each other. *R. A. Rolfe.*

EPIDENDRUM IONOSMUM, Lindl.

"The Western world wants no Violets where this charming plant is found, for it fills the air with a

fragrance as delicate and delicious as that of our favourite wild flower." Thus wrote Dr. Lindley when describing the plant in 1838 (*Bot. Reg.* xxiv., *Misc.*, p. 49), from a garden plant, imported from Demerara by the Messrs. Loddiges. And very fragrant it certainly is, as well as a few other allied species, of which *E. selligerum* and *E. virens* are especially noteworthy in this respect. There is a plant now flowering in the Kew collection which appears quite identical with the two solitary flowers in the Lindley Herbarium. In habit and general character it agrees with *E. selligerum*, which however has the front lobe of the lip acute, not obtuse as in the present species, while the violet colour on the lip is also wanting in the present species. Here the front lobe is yellow, with numerous radiating keels, which are paler behind, and streaked and splashed with small lilac-purple spots. It appears to be a rare species, for I have not seen a wild specimen, although the plant has again appeared in gardens. There are several species of this particular group which resemble each other rather closely, and some care is required to distinguish them satisfactorily, especially in the dried state. *R. A. Rolfe.*

PHAIUS MACULATUS.

There are very few Orchids other than the *Anæctochile* that can be classed as fine-foliage plants; the above is one, however, well worth growing for the beauty of its leaves alone. One or two healthy plants would quite redeem the usual uninteresting appearance of a shelf of Orchids when out of flower. The plicate leaves vary from 1 to 2 feet in length, and are dark green, irregularly marked with numerous yellow spots. The whole of the flower is of a bright yellow colour, except the centre of the lip, which, being thickly striped with brownish-crimson lines, forms an effective contrast to the other parts. A plant now flowering at Kew carries eight or ten spikes—one bearing sixteen flowers. Like the other species of *Phaius*, this one is benefited by having a good proportion of loam in the compost, and may be grown in the warmest part of the cool house. During the growing season it requires abundance of water, and in the case of established plants an occasional dose of weak manure-water will be found beneficial.

COLLODYNE ELATA.

This species is widely distributed in Northern India, and although long known to botanists, it has not as yet been extensively cultivated. The flower-spikes are produced along with the young growths in summer, but the flowers do not develop until the following spring. The pseudo-bulbs are large and somewhat angled, and, like the leaves, are light green in colour. The flowers, which are densely arranged on the spike, are pure white with some orange-coloured markings on the lip. Imported pieces will become established and grow very well fastened to a piece of wood, with a little sphagnum and peat about the roots. It may then be suspended against the back wall or partition of the warm house, and should be syringed three or four times a day in summer.

LISSOCITRUS KRENSII.

Although not of such an imposing appearance as the species *L. gigantea*, shown by Sir Trevor Lawrence at the recent show in the Inner Temple Gardens, this is of sufficient merit to warrant its more extensive cultivation. The flowering period of a scape extends over two or three months, during which time it develops from twenty to thirty flowers. The sepals are green with purple blotches, while the petals, which are considerably larger and almost orbicular, are of a pale yellow colour; the lip is three-lobed, the lateral ones similar to the sepals in colour, and the central lobe of a rich bright yellow.

Of deciduous habit, this species needs a decided period of rest during winter to ensure its subsequent flowering. When the young growths appear, the plants should be potted in a compost of fibry peat with about half the quantity of loam, to which may be added some chopped sphagnum and silver-sand,

During growth it requires a moist position in the intermediate-house. An additional robustness will be given to the handsome plicate leaves, and to the flower-spikes, by watering at intervals with weak manure-water. *W. B.*

LELIA MAJALIS.

This Mexican species, when seen in good condition, is without doubt one of the finest of the genus. It blooms with the young growths in the summer months, and lasts a considerable period in great beauty, providing water is kept off the flowers. Most growers find the plant difficult to manage satisfactorily, but the little greater care which it requires in its cultivation is quite repaid by its burden of flowers. It is found to thrive best upon blocks suspended from the roof of the Cattleya-house, almost in the full sun, and requires a very liberal watering whilst growing. When the growths are finished they should be removed to a much drier and cooler temperature, so that the pseudobulbs may ripen thoroughly—an important point. A number of these plants are now flowering at the Vineyard Nurseries, Garston, Liverpool. *P. Ashton.*

TILLANDSIA VIRGINALIS.

THE plant from which the accompanying illustration (fig. 93), was taken, was one of the collection of Bromeliads purchased for Kew from the widow of the late Professor E. Morren. When it came to Kew it was a small plant, composed of a crowded tuft of linear grass-like recurved leaves, without any indication whatever of the character shown in the drawing. For about a year after its arrival at Kew this plant continued to develop the linear leaves, and then suddenly it commenced to push up broad strap-shaped foliage. There was no gradual change from one state to the other. As this character has not been observed in any other Bromeliad, its occurrence in *T. virginalis* seemed worth recording. The species is a native of Mexico. Its flowers are not attractive.

Medusa, *Miltonia vexillaria*, *Epidendrum vitellinum*, *E. Wallisii*, *E. atropurpureum*, and some other curious and pretty *Epidendrums*, *Catasetum trifidum*, *Dendrobium capillipes*, *D. Farmerii*, *D. Jamesianum*, *D. Bensoniae*, and many other *Dendrobes*; many fine *Masdevallias*, *Cattleya labiata* *Schroderae*, *Laelia majalis*, *Cologyne Mas-sangeana*, *Lycaste candida*, *Sobralia macrantha nana*, and a number of other species, showy, rare, or curious. The now favourite *Cypripediums* have among them the quaint *C. Sanderianum*, the fine hybrid between *C. hirsutissimum*, and *C. villosum*, *C. Germinyanum* ×, and *C. Druryi*; some new hybrids between *C. Hookeri* and *C. venustum*; *C. Tautzia-num* ×, a beautiful cross between *C. barbatum* and *C. concolor*; *C. Druryi*, and numerous other species and hybrids. The new *Dendrobium porphyrogas-trum* ×, and the lovely *Anguloa intermedia* ×, are still in bloom, as well as the favourite *Dendrobium enosum leucopterium* × and *D. splendidissimum grandiflorum* ×, the best of the section. The house of *Anthuriums* is now resplendent with scarlet spathes; the greenhouses showy with the New Holland and other plants; and the *Nepenthes*-house, wonderful as usual.

FIG. 93.—DIMORPHIC FOLIAGE IN *TILLANDSIA VIRGINALIS*.

Ferns.—The fine collection of these graceful plants in the ferneries at Chelsea give ample evidence that, although they are less written about than many other classes of plants, there are still plenty of admirers of them. Indeed it could not fail to be so, for if Ferns are regarded collectively, almost any feature desired may be obtained among them: be it colour rivalling the glow of flowers, then we have, as seen at Chelsea, the brilliant crimson tint of the young fronds of *Adiantum tetraphyllum*, the softer but no less bright fronds of *A. tinctum*, *A. Veitchianum*, and others; the rosy hue of *A. Farleyense*, *A. sentum*, and *A. rhodophyllum*; the blue tints of *Polypodium glaucophyllum*; the rich red of *Lomaria L'Herminieri*; the young fronds of *Lastrea erythrosora*, and the neat *Doodia aspera corymbifera*, and the bright crimson sori of *Lastrea prolixa*; the white, red, and green of *Pteris tricolor*, and of *Athyrium Goringianum pictum*. With these mingle the bright gold and silver of the *Gymnogrammas*, and the varied tints of green, and with all the beauty of colour enhanced by that grace and diversity of foliage to be found in ferns alone. Be it quaintness of form that is desired, then turn we to the various forms of *Platynerium*,

known as Stag-horn Ferns, the diverse fronded *Davallia heterophylla*, *D. parvula*, *Rhipidopteris peltata*, and the numerous crested forms which cultivation seems to have been so instrumental in producing in Ferns. Among these *Lastrea tenericaulis cristata* and *Osmunda japonica cristata* are especially noteworthy.

Elegant Ferns for basket or pot are numerous represented; perhaps the fairy-like *Davallia tenuifolia Veitchiana* is the most charming, but *D. Mariesii*, *D. M. cristata*, the ample and beautiful *D. retusa*, the noble *Neprolepis rufescens tripinnatifidum*, the old but still rare *Asplenium appendiculatum*, and the graceful *Asplenium faccidum* are among the best; while the different varieties of *Platyloma* of the *P. flexuosa* section are charming in tint and in the arrangement of their fronds.

Among the new or little known Ferns we noted *Asplenium pterioides*, like a large scaly *A. marinum*; *A. Richardsoni*, an elegant species, something between *A. Fernandezianum* and *A. alatum*; *Gymnogramma Pearcei robusta*, the coveted *Pearcei*, but with a good constitution; *Lastrea lepida*, a beautiful finely-cut species; *Davallia feniculacea*, good for pot or basket; a large-growing *Vittaria*, with divided points to the fronds; *Nephrodium patulum*, from Jamaica; *Aspidium tripterum*, with pretty three-parted fronds; *Gymnogramma schizophylla gloriosa*, and *Todea Mooreana*, a noble Filmy Fern. But with respect to this last-named, which was imported as a species, a curious incident arises, for it is identical in every respect with the fine hybrid raised by Mr. Schneider, the foreman over the Fern department, and named and awarded a First-class Certificate as *Todea grandipinnula*.

Tree Ferns abound at the Royal Exotic Nursery, also hardy British and exotic species; and the rockery-house is very effective, prominent species being *Agathis dealbata*, *Todea arborea*, *Woodwardia radicans*, and *W. r. Burgessii*; *Pteris adiantoides*, *Lastrea atrata*, *L. aristata variegata*, *L. opaca*, *L. varia*, *Struthiopteris germanica*, *Osmunda javanica*, *Stenochlaena scandens*, *Adiantum Pacotii*, *Lomaria Gilliesii*, *L. chilense*, *L. zamioides*, *Lygodium palmatum*, and other *Lygodiums*, *Adiantum pedatum*, *Doryopteris nobilis*, *Balanium culcitum*, the pretty fragrant *Aspidium fragrans*, &c.

Ferns for indoor decoration have commanded great attention of late years, and here it is made a special feature. We found various forms of *Pteris serrulata* and its crested varieties in great bushy plants in small pots, the fronds not having a blemish on them. Also *P. tremula foliosa*, a noble Fern, and *P. t. flaccida*, with elegantly elongated points to the fronds; *P. cretica*, and its varieties; *P. Ouyardii*, intermediate between *P. cretica* and *P. umbrosa*; *Aspidium capense*, which stands indoors as long almost as an *Aspidistra*; *Adiantum cuneatum*, that most serviceable of all *Adiantums*; *Polypodium aureum*, *Asplenium biforme*, also a durable Fern; *Aspidium falcatum*, *A. setosum*, and numerous others, all cultivated up to the highest pitch of excellence, without which they are of little use for decorative purposes.

A good collection of *Gleichenias* and Filmy Ferns are also to be found at Chelsea, and, like the other plants, in such sound condition that they speak highly of the diligence and skill of Mr. Schneider, their grower.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY.

Never perhaps has the extensive and varied stock in Mr. B. S. Williams' famed establishment looked better than at the present time, when to the beauties of the fine collection of Ferns, Palms, and stove and greenhouse foliage plants, are added the fine display of flowers on the Heaths and New Holland plants, *Pimeleas*, &c.; the latest of the *Amaryllis* and *Cliveas*; the cheerful display of *Pelargoniums* and other plants, usually denominated "decorative"; the numerous brilliant scarlet spathes on the varieties of *Anthurium Scherzerianum*, the

NURSERY NOTES.

MESSRS. J. VEITCH & SONS.

Gloxinias.—In Messrs. J. Veitch & Sons' Nursery, Chelsea, the house of *Gloxinias* in full bloom presents one of the most gorgeous sights a lover of handsome, varied and showy flowers could desire. Especially superb are the vivid scarlet and crimson sections—some edged with pure white, some with white or mottled throat, and indeed all sorts of pretty combinations of colour; the pure white and the spotted forms also exhibit great strides, indeed the whole strain seems to leave nothing to be desired. A curious feature is noted in this strain, which Messrs. Veitch have so persistently worked on, viz., that whereas in the old *Gloxinias* and earlier hybrids with *Sinningia*, the least check caused the flowers to fall off, the Chelsea strain have resulted in persistent flowers which, generally speaking, keep on their stalks instead of dropping, thus continuing the bloom for a much longer period than usual. This is a great advantage, and especially to exhibitors, who with the old sorts often had the chagrin of unpacking the plants with fallen flowers for their exhibition stand.

Orchids.—A fine display of noble plants of *Laelia purpurata*, *Cattleya Mossie* and *C. Mendelii*, *C. Skinneri*, *C. S. alba*, and other *Laelias* and *Cattleyas*, is now to be found in the great *Cattleya*-house, and an equally admirable arrangement of flowers in the *Odontoglossum*-house and intermediate-houses. Besides the grand show of *Odontoglossum Alexandrie* and its varieties and hybrids, and *O. Pescatorei*, are some superbly coloured *O. cordatum*, *O. Sanderianum*, many *O. citrosum*, *Oncidium superbiens*, *O. macranthum*, *O. phymatocilium*, *O. leucocilium*, *O. nigratum*, *O. Forbesii*, *O. crispum*, *O. hastatum*, *Odontoglossum Roezlii*, *O. Thalenopsis*, *Bifrenaria vitellina*, *Nanodes*

neat and well-flowered Azaleas, the densely clustered pitchers in the well-filled Nepenthes-house, and many other plants with beautiful foliage or flowers which never fail to appear at this nursery, and among which are found many rare plants seldom seen elsewhere. But beautiful as many of the other plants are, it does not require an enthusiast to see that, as usual, here the best display is given by

The Orchids, and with these Mr. Williams has an excellent way of making an arrangement of the most attractive character in the entrance or the lobby attached to each house, the old species, and those likely to interest Orchid growers only, being allowed to flower in their places in the body of the house. The first group noted was tastefully arranged with Maidenhair Ferns, and composed principally of *Cattleya Mossiae* and *C. Mendelii*, *Acridis Fieldingii*, *A. crispum*, great masses of *Laelia purpurata*, *Cologyne Massangeana*, *Oncidium sacrodes*, with about 150 flowers on a spike, and a pair of *Masdevallias Harryana* with flowers of brilliant blood-red on clear yellow ground—certainly one of the best *Harryanas*, and flowering here for the first time. Also noteworthy in this group was a pretty *Cattleya Mendelii* much like *C. M. Rothschildiana*, but rather lighter in colour.

The lobby of the next house had in the back a grand variety of *Cymbidium Lowianum* surrounded by specimen *Laelia purpurata*, with in front of them *Cattleya Mossiae* and *C. Mendelii*, *Laelia elegans prasiata*, *Oncidium macranthum*, and *O. m. hastiferum* (true), *O. Jonesianum* and *Masdevallias* fronted by fine plants of *Miltonia vexillaria*, *Dendrobium thysiflorum*, and *Cypripediums*, the whole being set up with *Adiantums* and *Asparagus plumosus*, and overhead finely flowered plants of *Odontoglossum citrosium* in great variety. On the side stages are *Anguloa Ruckerii*, *A. Clowesii*, *Brassia Keiliana tristis*, *Dendrobium Dalhousianum*, *D. Bensonia*, *Cattleya intermedia*, *C. Schilleriana*, *Oncidium Sutunii*, *Epidendrum cochleatum*, *Burlingtonia fragrans*, *Miltonia Warszewiczii* *Weltoni*, *Laelia cinnabarina*, *Oncidium sessile*, &c.

The next house gave some fine *Vandas* in flower—*V. suavis*, *V. tricolor Patersoni*, *V. t. The Glen* var. *V. teres*, and others, and with them *Phalaenopsis Sanderiana*, *P. amabilis*, *P. Luddemanniana*, *P. rosea*, and *P. r. leucaspis*, *Thunia Veitchiana*, *Dendrobium Falconeri*, *D. Dearei*, *D. superbiens*, *Cologyne pandurata*, *C. asperata*, and *Saccolabium ampullaceum*.

The whole of the cold-houses were fairly filled with flowers of good *Odontoglossums*, *Masdevallias*, *Oncidium concolor*, *Cattleya Acklandiae*, &c., and the *Cypripediums* had among them, in flower or bud, *Cypripedium bellatulum*, *C. selligerum majus* ×, *C. grande* ×, *C. albo-purpureum* ×, *C. Ainsworthii* ×, *C. ciliolare*, *C. Hookeri*, *C. Swainianum* ×, *C. superciliale* ×, *C. cardinale* ×, *C. vernixium* ×, *C. Argus*, *C. superbiens* *Denidolf* var.; *C. Dominianum* ×, and many others, the whole collection being in excellent condition, the plants sound, and well rooted.

THE APIARY.

HOW TO GET A SURPLUS.

I HAVE more than once before mentioned the subject of reversing, but as my object is to give the benefit of my own experience to the readers of the *Gardeners' Chronicle* I must again refer to it. The object of keeping bees being to get honey, I will state what has happened here during the last few days. I had a large Pettigrew skep, with a flat top and circular hole in the middle of said top. About a fortnight ago I found that this skep of bees was in very good condition. It was full of bees, and the comb reached to the floorboard. From the gathering of bees at the entrance I concluded that preparations were being made for swarming, and I meant to prevent that taking place. I had a section crate which holds thirty-two 1 lb. sections, so I got all things ready and went to the bees one evening when the

greater number of them were at home. I smoked them well to drive them upwards amongst the combs. I have occasionally had a piece of comb fall—in such cases the bees sometimes unite such a piece above. To guard against that I took a strong carving-knife and slipped it all round carefully between the hive and the floorboard so as to loosen all attachments. The hive being very heavy I had a man near to help turn the hive over, and block up the entrance; this was done carefully but quickly. The bees did not seem to relish the matter, for they were just beginning to come out in hundreds, when the super was placed on, and they had to rush into it. I ought to have said that the hive was propped up a little, so that the bees coming home had the same spot to fly to, and only had to crawl a little further, when they entered the hive by the circular hole which was at the top. There was a great rushing of bees about for, I should say, half an hour, when all seemed quiet. I left them for another half hour, when I lifted off the cover of the super, and found the bees examining the boxes. I have had a peep at the boxes most days since, without disturbing the bees at all, and they are filling them as hard as they are able. A perfect roar is going on inside the hive, the bees are bringing in immense quantities of honey, as well as pollen, so that matters are going on in a very satisfactory manner. Swarming seems to be given up at present, and I consider it very probable that they will not swarm at all. This hive is in an exposed part of the garden, so that all may see it who desire to. It is sometimes difficult to keep skeps from tumbling over when inverted, and some future time I will describe a way of preventing it. Meanwhile, try one skep if you are doubtful of success. *Bees*.

THE ORCHID HOUSES.

ÆRIDES ALPINE SUPERBUM AND *A. LOBLII*.—These two interesting East India species are not so often seen in collections as their merits certainly entitle them to be, and even when added to the collections they are sometimes indifferently grown. This cannot be because they are difficult to establish when first obtained as imported plants, nor, that they are hard to manage when once new leaves and roots are formed and fresh. Still there is a cause, and so far as I have been able to observe, even in Orchid growing the taste sometimes seems to run in one direction and at other times in another, and as just now we very seldom see a large mass of *Masdevallia Lindenii* or *M. Harryana* on an exhibition stage the same may be said of many of the *Acrides*, which used to be considered indispensable a few years ago. Doubtless, in a short time the East India plants will come again to the fore, and then we may hope to see these two fine species oftener and also grown better than at present. There can be no doubt that that section of Orchids which come under the appellation "cool house" are more commonly grown, and grand things these are; still many of the most beautiful of these require in their growing season a good share of heat—and if sunheat is wisely made the most of, fire-heat need be used but sparingly, that is, for three or four months; and the fact that this extra warmth is needed for their good cultivation should not deter any one from growing some of them. When an importation of these species is first received it will be noticed that the leaves are much shorter and closer on the stem than is the case with plants established here. Their appearance would indicate that they came from a locality where a large share of sunlight reached them, where growth was made rapidly, and where the resting season is a prolonged one. There will also be indications of the plants being abundant bloomers in their native country, although the spikes may be much shorter than those produced in our houses. In the matter of treatment, on being received the plants should be hung in the *Cattleya*-house round the stage, their heads being downwards, where they can be syringed, and slightly shaded; fresh roots will soon make their appearance, and old roots make new points over much of their

surface. Ere these new roots grow to any length, the plants must be put in baskets or pots, using crocks and charcoal very freely, and filling up the spaces on the top with fresh green sphagnum. If put in baskets, do not hang them up very close to the glass at first, any such sudden change of position acting injuriously, but after a few days they may be exposed to the light by degrees. Plenty of heat and moisture must be given during the growing season, but moisture stagnant in the pots, or an atmosphere which is close and stuffy, must be avoided. A buoyant condition of the atmosphere in the house is an essential condition, shade being given occasionally when strong sunshine might prove injurious. The growth having finished, and the winter approaching, warmth and humidity must be gradually abated, so that during the months of November, December, and January, the night reading of the thermometer will not be higher than 55°, and that of the day about 60°, with a corresponding dryness at the roots. *Vanda*.

PLANTS AND THEIR CULTURE.

THYRSACANTHUS AND *CENTROPOGON LUCYANUS*.—Both these plants require to be prepared for winter flowering during the summer months. Cuttings of either which were put in some time ago will now be nicely established and fit to pot on, and should be placed in their summer quarters, which may be a low-roofed pit or frame, when the best results may be looked for. But tolerable success may be attained by growing them with the mixed collection of intermediate-house plants, putting the plants on a shelf near the glass, such a position being best for small plants, and they will also branch sufficiently without pinching. If the number of plants is small, cuttings may yet be put in with a fair chance of rooting, and nice plants obtained if large cuttings be employed. The old plants may be utilised if cut back and re-potted, indeed, in the case of *Thyrsacanthus rutilans* standards with stems about 2 feet high are very useful for mixing amongst other plants, their long racemes of scarlet flowers being very telling. *Thyrsacanthus strictus* and *T. lilacinus* are the most useful next to *rutilans*; both are vigorous growers and more freely branched, as well as being taller; the erect spikes are scarlet and lilac respectively. *Centropogon Lucyanus* has rosy-carmine flowers, and seems to be the only species in common cultivation. It is a grand thing if done well, but it likes liberal treatment; good loam with plenty of bone-dust or a little fish-manure suit both it and the *Thyrsacanthus* well. If the *Centropogon* be planted out in such a soil, supplied with plenty of water, the temperature being kept at about 60° in winter, it will flower profusely for about nine months of the year.

Bomarea.—Distinct, handsome twining plants of the *Amaryllid* family, and somewhat resembling in flower the *Alstromerias*, to which they are allied; but not being so hardy as the last-named plants, they require the protection of a greenhouse or cool conservatory. Their culture is comparatively easy, and success is easiest attained when they are planted out and twined round some upright support, which may be either the slender pillars of the house or a stout stake. The plants are not particular as to soil—any free rich compost, such as one consisting of one-half loam, the other half leaf-mould and sand, or peat may be used in lieu of leaf-mould. The addition of a little bone-dust and charcoal improves the compost. The drainage should be good, for they like plenty of water whilst growing, but if the soil should get waterlogged they make slower progress, and some of the more slender growing sorts are liable to decay during the resting season of winter. At the present time the plants are making rapid growth, and are much benefited by frequent waterings with liquid manure, and by being syringed daily. Some care must be exercised in training and regulating the stems, for should their steadily turning points meet with an obstruction their course will get diverted, and the result is a tangled condition of the growths, difficult of undoing without injury; and the flowers being produced at the ends of the stems, it is essential that the growing point be preserved, otherwise no flowers will come, the stems not producing a new growing point from want of axillary buds. It therefore follows that propagation also can only be effected by seed or division. This slow mode of propagation has possibly had much to do with the slow pace at which these plants are being distributed, and as plants usually take quite a year to establish themselves into good flowering specimens, and seedlings double that time,

this may also have retarded their distribution. There are now a good many showy species introduced; but the finest of the family is *Carderi*, which produces a terminal umbellate head of flowers, averaging about 2 feet across on established plants. If it can be so arranged that the inflorescence hang over the path, or, at all events, clear of the surrounding plants, it is then a striking and effective object; and if produced in autumn, as they usually are, the flowers will last for a long time; and the fruits which follow are not without interest, especially when they begin to ripen, the colour then being a golden-yellow. Other desirable species are *oligantha*, *Caldasiana*, *conferta*, *frondea*, and *Shuttleworthii*. They are all terminal-flowered; the three outer parts of the flower are usually of one colour, and smaller than the three inner, which are generally spotted; the prevailing colours are rose, orange, yellow, and red, similarly disposed as in the allied *Alströméria*. They are easily kept clean, as, with the exception of *Carderi* (which is more or less evergreen), the stems die down after flowering, and thus the plants can be thoroughly cleaned. The usual small pests—greenfly, red-spider, thrips, and such-like—may easily be kept down by the free use of the syringe during the growing season. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

SHRUBS.—There are some few species of early flowering shrubs that are better for being pruned now than at any other time of the year; such are *Berberis stenophylla*, *B. dulcis*, *B. Darwini*; also similar subjects whose general character and habit consists of strong annual growth from which flowers are produced the succeeding year. The orthodox system, as is well known, is to prune shrubs between the months of November and March, but to employ this practice on such subjects as we are now dealing with is erroneous, as by so doing the plants are denuded of a goodly portion of their blooming shoots, besides spoiling their characteristic habit when in flower. The flowers being now past their best, all strong shoots should be cut back to a short spur, and from which young shoots will soon push forth; indeed in some instances they are already 4 to 6 inches long; an abundance of the latter well ripened to the points should be the desiderata, if a quantity be desired. The above remarks of course do not apply to berry-bearing species. Examine all late planted stuff and see that none of it suffers from want of water. Where flowers of hardy shrubs have to be sent long distances by rail for decorative purposes they should be cut and the stems placed in water a few hours previously to packing; and so treated, they will keep fresh for a long period; the contrary practice too often prevails, and is most disappointing in dry weather.

Hardy Wall Plants and Climbers.—These should receive close attention during the growing season, and should be nailed in, or tied to wire, as the case may be, and as often as occasion requires it, at the same time cutting out flowerless and superfluous shoots. Keep a vigilant look-out for aphids, and for their destruction employ the means which were recommended in the last Calendar for Roses, this being one which answers perfectly. *Clematis*, *Lonicera*, *Passiflora*, *Wistaria*, and other flowering subjects, will be benefited by waterings of weak liquid manure, with mulching afterwards, if such are growing in light soil.

Herbaceous Borders.—These will demand immediate attention, and in consequence of the dry weather lately experienced watering will have become necessary—any labour that can be spared for this purpose being amply repaid by a healthy growth, and well-developed flowers. It is a bad plan to wait till the leaves flag before watering—far better to err in the opposite direction. Do not delay to stake and tie all such plants as require it, and in doing so cut out weakly growths that are not likely to flower, from old-established plants of *Delphiniums*, *Phlox*, and others of a similar character; afterwards hoe and rake over the surface of the soil. Cut off old stems from early flowering plants, except where seed is wanted. In some gardens great demands are made on the herbaceous borders for supplies of cut flowers during the London season, and these should have their stems placed in water two or three hours before being packed, and are best when tied up in bunches of about a dozen with a little damp moss tied round the ends of stalks.

Dahlias may now be planted out, and see that they are well watered before turning them out of the pots, not forgetting to disentangle the roots slightly of all plants that are pot-bound, and which will greatly accelerate their taking hold of the fresh soil. Stake and tie as the work proceeds; cut out any young lateral shoots that may be pushing, allowing for some time to come, only one stem on each plant. For show purposes these plants are best grown in quarters which have been well manured and trenched over two spits deep the previous autumn. If planted in herbaceous and other mixed borders, dig out a hole and mix two or three spadefuls of rich manure with the staple previously to planting. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

VINES.—Where the Grapes are ripe a free admission of air should be allowed at all times, unless the weather be dull or wet. When the Grapes are approaching maturity, a gradual diminution of atmospheric moisture and a freer admission of air must be the rule; but at no time must Vines be allowed to become too dry at the root, more especially when there is a large quantity of foliage and a crop of fruit to support. Distribute a little water about the house, but at the same time keep up a small degree of artificial heat, so as to prevent it condensing on the fruit. If not already done, a good mulch of some sort of manure should be placed over the borders to prevent cracking of the soil and to save the too frequent use of the watering-pot, and, in the absence of rain, give the outside borders a good soaking of water. Every attention must be given to pinching back the lateral growths; on no account should they be allowed to run and then be removed wholesale, as this gives a check to the Vines, which may result in red-spider attacking the foliage, or in the fruit not attaining its proper size. The thinning of Muscats and other late Grapes should now be completed, every precaution being taken against touching the bunches with sweaty hands or the hair of the head. Avoid over-cropping, as it overtaxes the Vines, and delays the ripening of the fruit, which is never so finely finished. Keep a look-out for red-spider, and wherever it appears clear it off by sponging, or syringing, avoiding, as far as possible, touching the bunches, and let the operation be thorough in preference to weak daily syringings, less damage resulting to the fruit from the former method. Choose a clear night for the operation, as it is necessary that the foliage should be perfectly dry by the next morning. Any early viney which may be exhausted, and it is deemed necessary to renew, should be seen to at once, thereby saving a season.

I once planted two houses of Black Hamburgh in the beginning of June from Vines struck from eyes the same season; the Vines did remarkably well the same year—the result, partly, of the high temperature (85°) of the newly-made border, and next July they were at the top of the house. Early this spring I lifted the roots in an outside border of a Muscat viney and also those of a mixed house of Vines. The trouble and expense have so far been well expended, for the Vines are in better health than they have been for years, and the colour of the foliage indicates that the roots are in suitable compost. Encourage any Vines that were planted this year; ply the syringe vigorously, to keep the foliage clean; retain enough lateral growth to furnish all the trellis, but no more.

Pot Vines whose canes have grown to the desired length for next year's fruiting should now be stopped, and every possible care taken to preserve the foliage intact, as on this will depend the plumping of the buds for next season's crop, and the proper maturing of the wood. Assist the plants with rich mulchings and weak manure water, but take care that the roots are not allowed to enter the plunging material else proper control over them will be lost. *Wm. M. Baillie, Luton Hou.*

THE HARDY FRUIT GARDEN.

SUMMER PRUNING WALL TREES.—From this time forward, attention should be given at intervals to this operation, as the trees are now making rapid growth. Summer pruning requires care and forethought in the doing, so that the energies of the trees may be directed to the formation of bloom-buds, and the full development of the fruit. Trees which are inclined

to grow too luxuriantly must not be stopped at a too early stage, otherwise the lower lateral buds will be forced into growth, and bloom-buds will be few. A safe plan to follow is to stop young growths at the fourth, fifth, or sixth buds, according to the kind of fruit tree, and with regard to it being a strong grower or the reverse.

Pears will be the first fruit to claim attention, the breastwood requiring to be shortened back, and sufficient young wood laid in to meet requirements. If there are too many young shoots these should be regulated and also thinned (pulled) out by a sudden twist with the finger and thumb. Cordon Pear trees require frequent and close stopping, to keep them in a fruitful condition. The methods followed with Pear trees apply equally to Plums, Apples, and sweet Cherries, and with slight modification to red and white Currants on north walls.

Peaches and Nectarines.—The final disbudding should be brought to a close. A little attention should be devoted to tacking in the forwardest of the shoots, this work being more readily done now than later, when the wood gets firmer. The first thinning of the fruit may now take place, going over the trees finally when the stoning is over. Wash the trees well with water on warm days, and give an occasional syringing with soap-suds, or soft-soapy water to keep down aphids.

Apricot Borders.—When these are growing in well drained borders, another good soaking of water at the roots will be found necessary, when they will be quite safe till after the stoning of the fruits. Look over the trees frequently for the maggot, which, by the way, is unusually prevalent this year.

Newly Grafted Trees.—These must be examined to see that the ties are not cutting into the bark of scion or stock, and if this is found to be the case take off the old ties and rebind them again rather loosely, fastening them to sticks to prevent damage by wind, and rub off young growths as soon as such appear on the stocks. *A. Ward, Stok Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

PLANTING WINTER STUFF.—All plants of Broccoli, Brussels Sprouts, Savoys, Chou de Burgliley, Kale, &c., remaining in the seed-beds should now be planted out as soon as convenient, doing this work if possible in showery weather, and it is good practice to draw a shallow drill before dibbling in the plants. If the quarters are not yet vacant for the above, the plants should be pricked out at 6 inches apart in beds or lines, so as to prevent them from getting drawn, and if they are afterwards carefully lifted and planted with a trowel they will receive no check. One great cause of Broccoli failing to stand through a severe winter is that of being planted too closely in a soil that is too rich. If the ground is in good condition no manure should be afforded this crop, and the ground should be made very firm, the plants standing in rows not less than 3 feet apart and 2 feet apart in the row. Thus treated the tissues of the plants get well consolidated as growth proceeds, and are not so liable to be injured by frost, as those that are made soft by overcropping.

Cauliflowers for use in the autumn should now be planted out on well-enriched land, and encouraged to grow without loss of time, in order to get large heads. Cauliflowers will succeed better if the roots are carefully preserved when lifted from the seed-beds.

Successional crops of Lettuce should be put out as soon as large enough to handle; they grow away much faster when transplanted young, and are not so liable to run to seed in dry weather.

Chou de Burgliley should be sown now for cutting during February and March, that being the time of the year when it is most useful.

All Potato land should be at once hoed over, to destroy weeds, and the plants earthed-up when the tops are high enough. The hoe should be kept at work during dry weather among young growing crops. Preparation should also be made at once for sowing a good quantity of Marrowfat Peas for use at the end of August and onwards, at which time they are often very scarce after a dry time. As these crops will have to make their growth during the warmest season it will be better to sow them in trenches into which plenty of manure has been dug, and if the seed be well watered before covering it, its germination will be assisted considerably. *Ne Plus Ultra*, *British Queen*, and *Sturdy* are good varieties for sowing. *W. H. Davies, Kilton Hall, Sea-wood.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

THE GARDENERS' CHRONICLE who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

- MONDAY, JUNE 11—Chambre Syndicale of Ghent.
 TUESDAY, JUNE 12—Royal Horticultural Society: Scientific, Fruit and Floral Committees.
 THURSDAY, JUNE 14—Edinburgh Botanic Society.

SHOWS.

- MONDAY, JUNE 11—Bedford and Bedfordshire, at Bedford.
 WEDNESDAY, JUNE 13—York Floral Fête (three days).
 FRIDAY, JUNE 15—Scottish Pansy.

SALES.

- TUESDAY, JUNE 12—Imported and Established Orchids, at Protheroe & Morris' Rooms.
 WEDNESDAY, JUNE 13—Imported and Established Orchids, 70,000 Palm Seeds, &c., at Stevens' Rooms.
 FRIDAY, JUNE 15—Imported and Established Orchids, at Protheroe & Morris' Rooms.

The man who devises a novelty in the midst of the London season surely deserves almost as well of his fellows as he who makes two blades of grass grow where one only was found before. Moreover, when the novelty takes the form of practical benevolence, and the poor and helpless are substantially benefited, its value is very materially enhanced, and what was before a mere pastime becomes a praiseworthy act of beneficence. The Gardeners' Orphan Fund was started in the year of Jubilee by the gardeners themselves as their memorial of the event, and has been so far signally successful. Nor is it difficult to see the reason. As soon as the project was started by Mr. PENNY and Mr. CLAYTON, and mooted in the columns of the Press, it was taken up in earnest by a committee, which has worked with as much business-like tact as it has manifested zeal and energy. The whole affair is eminently creditable to the gardening fraternity, who have on this occasion displayed a spirit of harmony and co-operation not always obvious in horticultural matters. The gentlemen to whom the happy thought occurred of inaugurating the novel *fête* in the Flower Market on Wednesday last, are specially entitled to a tribute of gratitude for their efforts. Few professed Londoners, or even enterprising foreigners, who do their Covent Garden in the early morning in compliance with the recommendations of their Guide-book, ever penetrate into the handsome and

spacious building devoted to the purposes of the wholesale Flower Market. Few even know where it is, or realise the fact that the great portals adjoining this office give access to one of the most bustling, and at the same time most beautiful scenes to be witnessed in any city.

The portals aforesaid, like those in Tavistock Street, are indeed, closed for the greater part of the day but just when most people are thinking of ceasing work for the day, or of retiring to rest, this part of the market begins to assume a lively aspect, while during the small hours of the morning the business runs fast and furious. Traces of the fray may be seen in Wellington Street, and the other streets leading out of Covent Garden, as late as 9 or 10 o'clock, while residents and passers-by find not only the roadway blocked with vans and carts of all descriptions, but even the footway thickly covered with Hydrangeas, Cyclamens, Marguerites, Pelargoniums, Mignonne, Chrysanthemums, or cut flowers, according to the season, but always in bewildering profusion. The leather-lunged coster, as hard-working as his useful and long-suffering companion, the donkey, here gets his supplies, which he will retail in the suburbs an hour or two later, "all a-blowin' and a-growin'."

The ordinary gardener witnessing the spectacle may be pardoned for mingling a little envy with his admiration, for truly the "cultivation" of the plants here brought for sale, is of the highest excellence, and what is done with plants in "48-pots" continues to excite our surprise, all familiar, as we are with the sight. In truth, the cultivation of market plants is a specialty, and is carried to a degree of perfection to which none but specialists can hope to attain. Another point of interest (though that is not apparent in the market itself) is the economy with which the cultivation is carried on. To see that, one must go into the suburbs and witness the glazed shanties and make-shift places in which the plants are often grown. The sight affords a useful lesson, that expensive structures and elaborate appliances, though doubtless very convenient, are by no means essential to this class of business.

Another lesson is, that for trade purposes it is of no use to grow any great variety of plants, but only those few which have hit the public taste. To grow others simply because they are beautiful or interesting, is, from this point of view, merely folly, and certain to prove disastrous financially. And hence it comes about that the varieties of "market plants" are comparatively limited as to numbers, the limitations being fixed by public caprice as well as by the circumstance that certain varieties lend themselves well to rapid systems of propagation and quick cultivation, while others are not so pliant. The practical man soon ascertains which are likely to suit his purpose, arriving at his conclusions, as to the development of the fittest, by a rapid process of inductive reasoning, which the physiologist watches with admiration, but which he is unable to imitate, still less to account for. Mixed with all this beauty and triumphs of skill there is, in general, the noise, the confusion, the litter of a great market, frequented by bronzy-complexioned carters and porters, blue-aproned gardeners, and stout dames with huge baskets, frowsy shawls, and astonishing feathers in their limp hats. The picture indeed is one which, despite the beauty of the flowers, and its interest to the student of Nature, human and other, most people would prefer to see at a distance; indeed, it is usually made obvious to strangers that their room is more valued than their company.

But see how the "one touch of Nature makes the whole world kin." The need of the helpless orphan on this occasion silenced the turmoil, banished the confusion, and left only the brilliancy and fragrance of the flowers to be admired by the visitors, and to form an appeal to their generosity, the force of which they cannot withstand.

The weather had been threatening during the day, but towards evening it became clearer, and decidedly warm. Too much cannot be said for the great enthusiasm and zeal exhibited by the numerous salesmen and growers who habitually attend the Flower Market, and who on this occasion staged their beautiful wares in unwonted profusion, and, it is almost needless to say, their best examples. The banks of flowers in the many alleys of the market were bewildering by their galaxy of colour and the exceeding variety of flower and foliage plants of which they consisted. To give the names would require more space than we can command, and we can but allude to those which occurred the more generally, viz., Carnations, Roses, zonal Pelargoniums—still Geraniums in market parlance—Hydrangeas, hortensis in variety, and paniculata, very finely grown and flowered; Ivy-leaf, decorative, show, and fancy Pelargoniums, of dazzling tints, unknown a few years since; Petunias, Lilies, Narcissus, Iris germanica in varied colours, Fuchsias, Calceolarias, glowing Papaver bracteatum, Lobelia erinus in beautiful variety; Paeonies, Marguerites in white and gold; in some stands a few Philoactis made their appearance, in others a few Orchids were to be seen. "Foliage" consisted of the ever desirable Indian rubber plants, Tillandsias, graceful Kentias, Phœnixes, Livistonias, Pritchardias, Blechnums, Lomarias, gold and silver Gymnogrammas, Adiantums in variety and without number, Isolepis gracilis, Caladium argyrites, C. minus erubescens, &c. The numbers who visited the display numbered about 7000, and included the Marquis and Marchioness of Tavistock, Sir Julian Goldsmid, Bart., M.P. (President), and Lady Goldsmid; the Right Hon. the Lord Advocate of Scotland, the Right Hon. J. Chamberlain, M.P., Sir T. Lawrence, Bart., M.P., General Goldsworthy, M.P., Lord and Lady Sudeley, the Right Hon. Hanbury Tracey, the Earl and Countess of Darnley, Lord and Lady Dimsdale, the Hon. Percy Allsopp, M.P., and the Hon. Mrs. Moore, Lord Justice and Lady Denman, Lord Justice and Lady Chitty, Lord Justice Hawkins, Colonel and Mrs. Cornwallis West, Colonel and Mrs. Grant, W. T. Dyer, Esq., C.M.G., F.R.S., D. Morris, Esq., F.L.S., N. Sherwood, Esq., and Mr. and Mrs. Protheroe. The Marchioness of Tavistock and Lady Goldsmid were each presented with a handsome bouquet of Orchids by Mr. T. A. Dickson, Covent Garden.

The Duke of Bedford, who was unfortunately unable to attend the *fête*, kindly contributed to the funds by a donation of £100. The sum placed in the collecting boxes, which were watched over by twenty-eight young ladies, raised the total to over £227—a very welcome and satisfactory addition to the funds of the charity.

The acting committee consisted of the following gentlemen, who worked most assiduously from first to last, viz.:—Messrs. Deal (Chairman of the Fund), Assbee (Market Superintendent), Richards (*Fête* Secretary), Barron (Hon. Secretary of the Fund), Walker, Pountpart, Head, May, Evans, Roupell, Messer, Lewington, Nicholson, Wotton, Gregory, Sharmman, Poulton, Rochford, Turner, Hayes, Hawkins, Dean, Dickson, Herbst, and Laing. It is

FIG. 91.—PINUS CANARIENSIS, SHOWING CONE, MALE CATKINS, BUDS AND FOLIAGE, ETC.: NATIVE OF THE CANARY ISLANDS. (SEE P. 723.)

also satisfactory to note that, notwithstanding the great crush of visitors during the evening, all passed off in a thoroughly satisfactory manner without accident.

In illustration of the spirit with which this most interesting and agreeable spectacle has been carried out we may, in conclusion, quote the words of one of the most earnest of the promoters—a man whose hard daily toil and general surroundings would not predispose one to credit him with much fine feeling, but beneath whose rough exterior it is evident there beats a heart that can feel for another:—"Sir," said he—we were conversing with him on the matter—"we all like to do a little good to others when we can." This is the spirit in which this novel enterprise has been carried out, and we heartily congratulate the promoters on the results.

It may be stated that the salesmen in the market have not had a better demand for their goods this season than on Thursday morning after the *fi*te.

INSTITUTE OF FRANCE.—Dr. M. T. MASTERS, Editor of this Journal, has been elected Corresponding Member of the Institute of France—Botanical Section—in place of the late Professor ASA GRAY.

THE "BOTANICAL MAGAZINE."—In the number for June are the following plants:—

Catasetum Bungeorhizii, a complete description and figure of which appeared in our issue for January 29, 1887, and which was supplied by a plant in the possession of Mr. TAUTZ, of Studley House, Shepherd's Bush. It appears that the species is subject to considerable variation, the varieties aureum and Pottsiannum differing slightly from each other, and both again from Mr. Tautz's plant. The specimen figured is from a plant that flowered at Kew in October of last year, and which has pale greenish-yellow flowers, and is destitute of the sharp toothlets on the margin of the lip, though there are traces of them.—Venezuela.

Kompheria secunda.—Stems erect, loosely tufted, 6—10 inches high, slender, simple, sub-cylindric, leafy all the way up. Leaves 3—3½ inches long, the lower smaller, membranous, obliquely lanceolate or elliptic-lanceolate, caudate-acuminate, base narrowed, sessile on the sheath, which is slightly compressed, and terminates in a broad obtuse membranous appressed ligule, bright green above, paler beneath. Spike terminal, few flowered. Calyx tubular, slender, split above. Corolla tube nearly an inch long. Lateral staminodes broadly oblong, or rounded, spreading, and rather reflexed; lip rounded, shortly bifid at the extremity; colour rosy-purple.—Khasia Mountains.

Huernia aspera.—A tropical African member of a genus that has been known hitherto to occur only in South Africa. It closely resembles a *Stapelia* in habit. Stems straggling, procumbent, purplish-brown, with ascending divaricate, green cylindric or fusiform branches, ½—4 inches long. Leaves minute, toothlike. Flowers few in a sessile cyme, pale purple coloured veins; corolla nearly 1 inch in diameter.

Palaecourea nicotianefolia.—A shrub with branches terete or nearly so, all parts but the upper surface of the leaves clothed with a very fine tomentum. Leaves opposite, elliptic-lanceolate, 5 to 9 inches long, and 2 to 3 inches wide, acuminate, rather membranous, bright green above, yellow below, with twelve to fifteen stout arching nerves, midrib reddish, nerves above are yellow, base narrowed to a petiole a quarter of an inch long. Thyrsus terminal or from the upper axil, 4—7 inches long. Flowers two-thirds of an inch long, shortly pedicelled and tubular, slightly swollen at the base, colour greenish-yellow.—Brazil.

Cassia coquimbensis.—A shrub with glabrous or finely, sparsely haired branches, and leaves on the under side. Leaves 2—4 inches long, leaflets four to six pairs, one-third to two-thirds of an inch long,

sessile, pale green. Cymes axillary, many flowered, sub-corymbose. Flowers 1—1½ inch in diameter, orange-yellow. Sepals oblong, obtuse, green, half the length of the petals.—Coquimbo.

THE "JOURNAL OF BOTANY."—The issue for June contains a portrait of the late ASA GRAY, together with an appreciative and sympathetic summary of his life's work, by the Editor. The other important papers are a synopsis of Tillandsieae, by Mr. J. G. BAKER, and "Notes on the Botany of Northern Portugal," by the Rev. R. P. MURRAY.

CAULIFLOWERS FROM FINISTERRE.—It is stated in the *Revue Horticole* that for the last fortnight there have been sent away from the railway stations of Saint Pol-de-Leon, Roscoff, and Plouéman, to all parts of France and of Northern Europe, from seventeen to eighteen wagonloads of Cauliflowers daily, each wagonload weighing 4000 kilos. It is calculated that the total quantity sent away during the sixty days of the Cauliflower season will reach 4080 tons, which, at the rate of 85 francs per ton, equals 346,800 francs, and the wholesale selling price of these by the dozen heads, at 2.50 to 4 francs per dozen, will realise 1,105,000 francs.

THE ALEXANDRA PALACE.—It is proposed to hold fruit, vegetable, and Potato shows during the present season, and a Chrysanthemum show in November at the Alexandra Palace. The new company, which has taken over the place, intends to be liberal in the matter of prizes, there being no want of funds.

PEOPLE'S PALACE.—On Friday and Saturday, the 1st and 2nd inst, a small exhibition of flowers, &c. was held at the People's Palace, Mile End Road, E., which must have been a welcome sight to many of the visitors. Messrs. J. LAING & SONS, Forest Hill, S.E., sent a very large group, 90 by 13 feet, which occupied the centre of the show hall; some cut blooms of their Begonias attracted much attention; various Palms, Caladiums, and *Araucaria excelsa*, formed the main items here. Cut Roses were sent by Mr. W. RUMSEY, Waltham Cross, N., who also showed some excellently grown *Adiantum* in variety, including *A. Farleyense*. A bank of hardy cut flowers was contributed by Messrs. BARR & SONS, Covent Garden, W.C., which included many things of bright and gay colours, as Irises, Peonies, Parrot Tulips, &c., and a head of *Allium Karatavensis* with pink flowers. Market bouquets of very tasteful arrangement, and baskets of cut blooms of double white *Narcissi*, scarlet *Ixias*, *Scilla nutans*, and grasses were sent by Messrs. HOOPER & Co., Limited, Covent Garden. Groups of market plants of good quality were shown from Mr. WILKINSON, Mile End Road, E., and Mr. CROSS, Leytonstone, E.

BRITISH TOBACCO.—At the Fenchurch Street bonded warehouse there has been held a small show of British grown Tobacco, under the auspices of the London Chamber of Commerce. Very fair samples of leaf were to be seen, there being twelve lots, but not yet ripe enough for use. The prize of £50 was awarded to Messrs. J. CARTER & Co., High Holborn, who had a good quantity of leaf; but other exhibitors also had equally good leaf, but not so large a quantity. Sir E. BIRKBECK, Bart., M.P., Norwich; Mr. W. E. WYAN, Maidstone; and Mr. J. GRAVES, Skirbeck, Boston, Lincolnshire, were recommended for the second, third, and fourth places respectively.

MYOSOTIS DISSITIFLORA ALBA.—We have received from M. ERNEST BENARY, Erfurt, flowers of a white Forget-me-Not—*Myosotis dissitiflora alba*. It is the exact counterpart of *M. dissitiflora*, and it is stated to come absolutely true from seed. A valuable addition to these much employed spring flowers.

ARISTOTELIA RACEMOSA.—Shoots of this plant have been kindly sent by Mr. F. W. BUNNAGE, Trinity College Botanic Gardens, Dublin, who says that the

plant is now flowering there, as a hardy shrub, on a south wall, at five years from seed. It is 3 feet in height. It is not showy, but is a shrub of clean, bright, and pleasing aspect, and it does not seem to be very common in gardens. The foliage sent quite bears out Mr. BUNNAGE's remarks as to its aspect.

HOSE-IN-HOSE MIMULUS.—Messrs. H. CANNELL & SONS send some exquisitely coloured flowers of *Hose-in-Hose Mimulus*, the colours running chiefly on rich velvety-brown and bright shades of yellow and crimson, fine for pots, or beds in half shady places.

ROSE SHOWS IN 1888.—The following list of shows up to date has been sent us by Mr. EDWARD MAWLEY, Rosebank, Great Berkhamsted:—

Tuesday,	June 26—Boston.
Thursday,	.. 28—Brockham and Byde.
Saturday,	.. 30—Eltham and Reigate.
Tuesday,	July 3—Bagshot, Canterbury, Diss, and Hereford.
Wednesday,	.. 4—Croydon, Dursley, Farnham, Hitchin, and Richmond, Surrey.
Thursday,	.. 5—Bath, Farningham, and Norwich.
Friday,	.. 6—Sutton.
Saturday,	.. 7—Crystal Palace (National Rose Society).
Tuesday,	.. 10—Gloucester, Ipswich, and Oxford.
Wednesday,	.. 11—Ealing and Taunbridge Wells.
Thursday,	.. 12—Birmingham, Carlton-in-Lindrick, and Wimblesbury.
Saturday,	.. 14—New Brighton.
Monday,	.. 16—Newcastle-under-Lyne.
Tuesday,	.. 17—Leek and Ulverstone.
Wednesday,	.. 18—Birkenhead.
Thursday,	.. 19—Helen-burgh.
Friday,	.. 20—Darlington (National Rose Society).
Saturday,	.. 21—Manchester.
Tuesday,	.. 21—*Christleton and Tibshelf.

* Not yet finally decided.

In the above list the only exhibitions not held by the National Rose Society or by societies in affiliation with it, are those at Birmingham, Boston, Carlton-in-Lindrick, Dursley, Manchester, Newcastle-under-Lyne, and Richmond. In the case of Birmingham and Boston, where the shows extend over two days, the date of the first day's exhibition only is given.

NON-GUARANTEE CLAUSES.—At a largely-attended meeting of the National Seed and Nursery Trade Association, held in Edinburgh on Wednesday, 6th inst., Mr. WATT, Carlisle, presiding, a resolution that the meeting entirely disapproved of the non-guarantee clauses of seedsmen, &c., was unanimously adopted.

A NEW NURSERY VENTURE.—The various nurseries belonging to Mr. R. H. VERTEGANS, Chad Valley; Mr. HANS NIEMAND, Harborne Road, Birmingham; and HEWITT'S Nurseries, Solihull, will shortly be incorporated as a limited liability undertaking, under the title of VERTEGANS & HEWITT (Limited).

CROYDON HORTICULTURAL SOCIETY.—At the show of the above Society, to be held on July 4, a competition, open to all England, for gentlemen's gardeners and amateurs only, a special prize for thirty-six Roses (distinct) will be awarded, consisting of a Rose trophy, value 25 guineas, and the National Rose Society's Gold Medal. This trophy to be held by the winner for the year. If won by the same member for two consecutive years it will then become his property. A special prize for six Roses (distinct) will also be competed for by gentlemen's gardeners and amateurs within a radius of 4 miles of the Town Hall, Croydon, a Rose trophy, value 7 guineas and the National Rose Society's Silver Medal, being the awards, the former to be held by the winner under the same conditions as the higher award above mentioned.

BANANA CULTURE IN CENTRAL AMERICA.—From two Consular Reports recently received—the first from Carthage and Santa Martha, and the other from San José, Costa Rica—it would seem that the cultivation of the Banana is receiving a considerable amount of attention in Central America

At Riofio, some 15 miles beyond Cordoba, the land is described as being very fertile, and with the prospect of the railway shortly connecting this locality with the port of Santa Martha, the Banana cultivation has been started with the view of exporting the fruits to the United States of America, where there is an ever-increasing demand for them. This particular cultivation is said to have the great advantage that the Cocoa tree can be planted beneath its shade, and by the time the Banana begins to degenerate and has to be cleared away, a valuable Cocoa plantation is there to replace it. The lands of Riofio are also especially adapted for the successful production of Cocoa. The report from Costa Rica says:—"The Banana grows best in the lowlands, hot and even marshy plains, where the tropical rains most abound. There are large tracts of land on the Atlantic coast in the plains of Santa Clara through which the railroad runs from Carillo to Port Lemon—a distance of about 70 miles—which a few years ago was forest land, but now for the most part is cultivated with Bananas. This forest land can be bought at from £1 to £2 per 2 acres, the cost of cleaning is about £3, and eighteen months or less after planting the sucker the Banana tree bears fruit. Beyond keeping the land free from undergrowth the trees require but little attention. At present the fruit is bought, delivered alongside the railway, at 43 cents, or 1s. 4d. a bunch of nine hands, and 2½ cents, or 8d. per half bunch of seven and eight hands."

THE COLCHESTER AND EAST ESSEX HORTICULTURAL SOCIETY.—The above Society will hold a Rose Show on June 30, at which liberal prizes will be offered to amateur competitors.

PINUS CANARIENSIS.

The remarkable Conifer of which we are now able to give a representation (fig. 94, p. 721), thanks to the courtesy of M. Naudin, is one which in this country we rarely, if ever, see out of the conservatory, our climate presumably not suiting it. Nevertheless, there are warm corners near the sea, as in the Channel Islands, where it might be tried, and numberless localities in our broad empire where the tree would find the requisite conditions for its growth. It is a native of the sides of the mountains of the Canary Islands—indeed, it is peculiar to them, not being known elsewhere. Possibly it may at one time have extended over a wider area, whence geological changes have expunged it. Although the natives have done their best to extirpate it, it still forms, we believe, a component element of the forests above the line of the Laurels, at an elevation of between 5000 and 7000 feet. Moreover, it has been introduced so freely into other countries, that we trust we are not likely to have to figure it as the last of its race, as we did lately with the St. Helena Psiadia. The Pine in question is fully described in botanical works, especially by Webb and Berthelot, and our illustration tells its own tale so completely, that we need add but little of botanical detail; but as points to be specially noted, we may mention the greyish-lilac bark, the yellowish shoots, the lanceolate, deeply-fringed scales at the base of the "needles," which scales are the primary form of the leaves. The secondary leaves, or needles, are of a grass-green colour, and in tufts of three, like the American Tueda. In section the leaves are triangular, the lower side very convex, the other two sides not concave as usual in Pines, but also slightly convex. Beneath the skin is a very thick layer of strong wool cells (hypoderm), which enables the leaf to resist the violent winds to which the tree is subjected.

The two resin-canals are deeply imbedded in the substance of the leaf—a character of much importance as regards the discrimination of the species. The densely woolly buds will also be noticed, as also the large oblong mass of yellow catkins constituting the male inflorescence. The cones are at first ascending or horizontal, but subsequently pendulous. In the works

referred to, some remarkable specimens of the tree are alluded to, and the power which the tree has of resisting the violent winds and drought to which it is subjected—a power the explanation of which is partly afforded by the minute structure of the leaf above explained, and partly by the strong root development. The roots penetrate the crevices and fissures of the volcanic rocks to a great depth, and derive moisture from sources which are little apparent on the surface. The robust gnarled habit of the tree assorts well with the rugged character of the rocks amid which it grows. M. T. M.

NOTICES OF BOOKS.

JOURNAL OF THE BATH AND WEST OF ENGLAND SOCIETY.*

The recently issued number of this Society's *Journal*, which we find has now been established more than 110-years, contains several very able and practical articles in connection with agriculture and horticulture; in fact, the book teems with useful information.

Our limited space will allow of but a short notice on the two articles more particularly bearing on horticulture, viz., "Insects Injurious to Apple and Pear Crops," by Charles Whitbread, F.L.S., F.G.S.; and "Fruit Farming in Small Holdings," by W. Weldon Symington, of Rockside, Okehampton.

I. INSECTS INJURIOUS TO APPLE AND PEAR CROPS.

The author says the serious destruction to the Apple crop in certain seasons by the Apple-blossom weevil (*Anthonomus pomorum*) is hardly realised, or at least is generally attributed to other causes—as the weather, for instance, and moths and saw-flies. In seasons in which the development and growth of the Apple blossoms are retarded by cold nights and white frosts this insect has great opportunities, and does not fail to avail itself of them. On the other hand, when the blossoms come out quickly, and fructification and the formation of the Apples follow on without let or hindrance, much of the risk is diminished, because it takes some time for the eggs of the weevil to hatch after being placed upon the buds, and the most important harm is occasioned in the early stages of the blossoms. Also, when the petals expand the larvae of the weevils are deprived of necessary shelter from sunshine, wet, cold, and possibly white frosts, and are unable to pursue their evil courses.

PREVENTION.

"Most difficult it is (says the author) to devise effectual methods of checking and preventing these very tiny creatures, endued as they are with double means of locomotion, taking up their quarters in the hearts of the buds, from which they cannot be dislodged. After a bad attack, the stems and limbs of the Apple trees for some distance beyond the forks should be well scraped and washed over, with a mixture of lime-wash and paraffin oil, in the proportion of half a pint of oil to 1 gallon of wash, well stirred together and well brushed in. A little soft soap, or size, might be added to make the composition adhere to the bark. Carbolic acid may be used for paraffin, in the proportion of a pint to 5 gallons of wash. . . . It is most desirable to keep the grass very short all round the trees in orchards—either fed close by sheep or mowed off, and to remove all stones, rubbish and weeds. With regard to Apple trees upon cultivated land; they should be dug round as deeply in the late autumn as the proximity of the roots to the surface will allow, and hoed deeply in the early spring with lime, lime-ashes, or earth, ashes or sawdust steeped in paraffin oil or carbolic acid, dug or hoed in."

REMEDIES.

No practical remedies can be suggested for adoption in the case of orchards and plantations. In

* *Journal of the Bath and West of England Society and Southern Counties Association.* London: Edward Stanford, Charing Cross, S.W.

gardens, it might be possible to dislodge the beetles, before they could lay eggs by shaking the espaliers, half-standards, bush-trees, and cordons.

THE PEAR SAW-FLY (SELANDRIA CERASI).

All fruit-growers and gardeners have remarked the action of a curious-looking insect resembling a slug upon the leaves of Apple, Pear, Cherry, Plum, and Damson trees. Though to all appearance it is but a mere lump of slime or dirt upon the leaves, it nevertheless soon eats away their soft green tissues, leaving only the nerves or ribs, so that the leaves become mere skeletons. This insect, the larva of a saw-fly, is most repulsive to behold, having a disproportionately large head, and a dark, slimy, viscid fluid covering its body. It is not at present one of the often recurring pests of fruit trees, like the Hyponometa padella and the Gooseberry saw-fly, though serious attacks have been reported, and it constantly attacks single trees here and there, both standards in orchards and gardens, as well as espalier and wall trees in gardens.

PREVENTION.

"As it is evident that the chrysalids cannot be far away from the fruit trees upon which the larva were reared, it would be well to dig the ground all round thoroughly, and to hoe it well with prong-hoes in the spring, taking care that the clods and lumps are well broken. . . . Upon grass orchards, and upon cultivated land, quicklime might be scattered round infested trees just before the general final change in chrysalids takes place, in order to kill them if they ventured into it."

REMEDIES.

Fine particles powdered upon the slimy bodies of the larva of this saw-fly renders existence burdensome to them. Thus, clouds of very fine quick-lime could be sent up by means of a machine like that used in Kent for putting sulphur upon Hop plants for mildew—at least upon the smaller trees and the lower branches of the larger trees. Except in the cases of Cherries this would not affect the fruit to a great extent. And with regard to Cherries, as a rule, these would be picked before the larva had done much mischief. In America, powdered Hellebore, mixed with water in the proportion of 2 lb. to 100 gallons, is syringed over the trees with good effect. Hellebore is, however, a far too deadly poison to be sprinkled upon fruit. If the fruit has been so injured as not to be worth picking, washing with soft soap and water, with the extract of 2 lb. of tobacco added to 100 gallons of water, put on with a washing engine, would effectually kill the larva, or make the leaves unpleasant to them. It is clearly most difficult to apply remedies to trees when the fruit upon them is plentiful and valuable.

Notices are also given upon five different kinds of moths, the Apple and Woolly Aphis, and the Mussel Scale (*Mytilaspis pomorum*).

2. FRUIT-FARMING FOR SMALL HOLDINGS.

The writer after stating his own experience in the work goes on to say:—"At the present moment, all those who have the welfare of the nation at heart are carefully searching for information as to the best means of finding employment for our now much over-crowded labour market, and also for a profitable means of utilising agricultural land now out of cultivation.

The popular cry has been for small holdings and allotments, so as to bring the rental and working expenditure within the reach of those who have only very small capital at their command; but it is quite impossible to work holdings, say up to 10 acres, for stock or corn-growing at a profit, unless the tenant has some other occupation than farming. . . .

Small holdings to be a success must be farmed in such a way that the tenant will be able to support himself and family; then any extra work he may do will be profit." This, it is stated, may be done by fruit farming. The author does not advocate the growing of fruits such as are imported from abroad, and will have to bear long carriage; but such small

fruits as Strawberries, Currants, Raspberries, and Gooseberries, and which are not liable to competition.

If attention is turned to the cultivation of those fruits only that are natural and almost indigenous to our soil, success would follow, and foreign competition defied, but if unsuitable crops are grown failure must be expected.

The author, however, concludes with the remark—"There is, however, no necessity for small holdings to be idle with an industry like this within the reach of willing workers, moderate intelligence, and small capital."

THE GARDENERS' RECEIPT BOOK. W. Jones. (Groombridge, London.)

Under this title is compiled a little manual for the use of persons who possess a garden; it contains generally reliable information, but it is marred by some receipts which are, to say the least, of doubtful efficacy. The author's acquaintance with the life habits of the American blight insect might be extended with advantage, as he does not appear to be aware of the existence of the insect in the soil about the roots of the Apple, and feeding on the latter. He is very free in advising the use of Nuxvomica and other poisonous substances as means for the destruction of insect life, and in such large quantities, too, that we assume he is ignorant of the provisions of the Sale of Poisons Act. At the end of the book there is given a vile method of destroying forest trees by means of a certain poison, and which we hope no reader of the book will ever be induced to put into practice.

HANDBOOK OF THE AMARYLLIDÆ; including the *Alstrœmeriæ* and *Ajaceæ*. By J. G. Baker, F.R.S., F.L.S. (G. Bell & Sons, York Street, Covent Garden.)

We have here a handbook of great value from the hands of a botanist who has made Amaryllidæ, Liliacæ, and allied genera, objects of especial study; and we are enabled to perceive, by a very cursory glance at the contents, that as a book of reference it will be of great value. We shall have pleasure in returning to the subject shortly.

EARLY MULCHING OF FRUIT TREES.

The highly beneficial effects of mulching are now generally known and admitted by most gardeners, but it is seldom that the operation is carried out in time to be of the great service it otherwise would be, as when deferred much of the moisture that might have been retained in the ground has evaporated, but when a mulching, even of a very slight nature, is put on, evaporation is intercepted, as the searching winds are prevented from acting on the surface and causing it to crack and gape. This being so, it will at once be seen how important it is to get the work done early, and especially is this so in the case of fruit trees and Strawberries, as not only does it save much time and labour in watering, but it keeps weeds down, and may be carried out more expeditiously now than when Strawberries get more forward, as the foliage spreads more then, and the stems are borne down by the weight of the fruit. As the lays on the mulching, the most suitable thing to use is clean straw, or fresh stable litter, which latter, if applied now, becomes washed and sweetened by the rain and air, and is not objectionable in any way when the Strawberries are ripe. Where Fern or Bracken can be obtained, and slugs are troublesome, that forms perhaps the best of all protectors, as it breaks and splinters up, forming very sharp edges and fine pointed ends, against which the slugs cut or pierce themselves, and soon beat a retreat. Bracken has also another advantage, in that it lays lightly and dries quickly, which is much in favour of the Strawberries, which, on an unsuitable bed, soon taint from mould, and rot if the night

dews be heavy or the weather wet. Market growers and others near towns often use tan, which generally may be got for a mere nominal sum, and a very good mulching it is, but when done with it should be all cleared off the ground, as to dig it in is harmful till it has become decomposed. As to the fruit trees, half-rotten manure answers well, but almost any rubbish may be given, the chief object being to shade the land; and prevent any washing when water is given. In regard to Peas and Scarlet Runners, these should always have a good mulching along each side of the rows. For flower-beds, cocconut-fibre is most excellent, and may be had cheaply; and leaf-mould and old Mushroom-dung are both excellent for the same purpose, and good afterwards for forking into the ground. J. S.

THE BROWN WEEVIL.

Will you allow me to call the attention of fruit growers and gardeners to this enemy, which has hitherto been overlooked by cultivators. It is a small earth-brown beetle, which, being nocturnal in its habits, is not often detected. Its habit is to climb up the trees and bushes in the twilight, and to devour the young buds as they appear. In May, until the buds sprout the weevils will eat away the bark from the ends of the shoots, more especially from the sharp angles left in pruning, leaving the ends bare. Its attentions are not confined to one kind of tree, as it may be found upon all fruit, nut, and many ornamental trees, which in isolated speci-

FIG. 95.—WEEVILS IN VARIOUS STAGES OF DEVELOPMENT.

mens it will denude of its buds, so that the trees appear dead. It also affects Roses, and can be found on Rhododendrons, Laurels, and such large-leaved evergreens, where it confines its attention to young tender leaves, which afterwards assume a jagged appearance. It is not a new insect, but is indigenous, and is spread over the whole country, and my object in calling attention to it is to state that tar and similar substances placed on the bark will not arrest its progress, and the only effective remedies are:—1. To catch them by night. One man carries a lantern, and another holds under the trees a net or white cloth, and the other throws the lantern on the tree, when they at once fall; the remainder (in the shady parts) will fall on a smart tap being given with the hand. The insects can then be collected and killed with hot water. They are so tenacious of life that none of the usual remedies will kill them. In fact, by accident, some were shut up in a tin box for twelve months, and then came forth lively. 2. They may be killed in the earlier stages by ramming the soil tightly round the stem of the tree or bush, and thus smothering them, but as they become perfect insects they are tough, and will stand a great deal without injury. 3. The soil round the trees may be made smooth with the foot, and a few flat stones or clods of earth may be laid on it. The insects will crawl under this in the daytime, and can be caught by lifting the clods and watching the soil; at first none may be seen, as they are so near the colour of the soil, but they will soon move to get away from the light, and then can be detected and caught. In my opinion the orchards suffer most when a plantation of Rasp, Currants, or berries, have been removed, as the insects then concentrate their efforts on the remain-

ing trees. As a rule they are not so abundant in grass orchards; cleanliness is very important, as they winter in tufts of grass, &c.

It only remains for me to say that its Latin name is *Otiorhynchus tenebriocosus*, and its allies, *O. picipes* and *O. sulcatus*, are also found on the same deadly work in its company; the latter is occasionally troublesome in vinerias. As the insect is now at work, prompt measures should be taken, as they will soon pair and lay eggs. Like other insects, it passes through an egg state, a larva or grub state, a chrysalis, and emerges as a perfect insect, or imago, in April or May, according to the weather. In the grub state it also does much damage to the roots of trees and plants. *George Banyard, The Old Nurseries, Maidstone, May 12.* [We reproduce, as many times before, an illustration (fig. 95) of these insects, of which we receive numerous specimens for naming each year. Figures of the insect, with suitable description, should be hung in every village school-room. Eo].

TREES AND SHRUBS.

THE MANNA OR FLOWERING ASH (FRAXINUS ORNUS)

is now beautifully in flower in the grounds at Hollydale, in Kent. What a pity it is that so distinct and beautiful a tree is not oftener met with in gardens. It is a miniature common Ash (*F. excelsior*) in general appearance, except in the sweet-scented panicles of greenish-white flowers. The tree at Hollydale is about 30 feet in height, perfectly conical in shape, and at present heavily laden with flowers. Near it is a Mulberry—the contrast between the now expanding leaves of the one and the loose open flowers of the other being very marked. The tree is not particular as to soil provided it is not peaty; it likes good drainage, and abundance of moisture. *A. D. Webster.*

THE HOP HORNBREAM.

Few popular plant names are more appropriate than the above, for the leaves can hardly be detected from those of the Hornbeam, while the female catkins resemble those of the Hop in a very marked degree. There are two species, one hailing from North America, *Ostrya virginica*, and the other from Europe, particularly from the south and south-eastern parts. As seen in this country the Hop Hornbeams are trees of a most distinct and pleasing appearance, and as they flourish well in various descriptions of soils, may be seen in good form, particularly in some of the southern English gardens. It is no uncommon occurrence to find specimens of the Continental *Ostrya vulgaris* of from 40 feet to 60 feet in height in this country, and with a head proportionately bushy. A medium-sized specimen of 20 feet in height when seen in full flower is certainly a pretty sight, the long drooping catkins being borne in great profusion. We cannot remember having seen the Hop Hornbeam in better form, or more ornamental in appearance, than recently in a friend's garden, where it was planted in front of a majestic specimen of the common Yew, in which position the singular catkins were shown off to the best advantage.

A strong loam seems to suit the wants of the European *Ostrya*—at least, in such soil may be seen some of the best-furnished and most healthy-looking specimens in the South of England; although from this we by no means wish it to be inferred that this tree will only succeed satisfactorily in such, for it may be seen growing vigorously in rather poor soil, as note the almost unique specimen at Kew.

The North American species, known in its native country as Ironwood and Leverwood, is likewise well worthy of attention, and is in every respect a fitting companion for the latter. We would strongly recommend any one in search of distinct and ornamental low-growing trees to procure specimens of the Hop Hornbeam. *A. D. Webster.*

CUPRESSUS LAWSONIANA LUTEA.

This variety is of graceful habit; the primary branches being sufficiently far apart and divergent to

break what would otherwise be a too uniform and less pleasing pyramidal surface of golden-green. Coloured or parti-coloured Conifers are doubtless useful in the economy of garden art; and this one, possessing, as it does, many excellent qualities, must take a first place among the many forms now available. Though evidently lacking in chlorophyll, it is nevertheless hardy in this country, and well deserves the name of a thrifty grower. It will be found to show to least advantage in rather dry, light soils, or others more substantial but impoverished by over-cropping, as in typical English "shrubberies," and in open windy positions, the general effects of which are premature defoliation, and stunted sickly coloured branches.

It is most amenable to the professional propagator's desires. In the interests of non-professional cultivators who would care to increase their stock of this variety, I may state that strong cuttings of two years old growth, 6 to 9 inches long, made early in October or in March, and placed at once slantingly in moist soil, and made firm, in the shade and under the shelter of a wall facing north or east, will, with little or no future care, form roots. In this position they should be allowed to remain undisturbed for at least two years.

I knew an old gentleman, some years ago, who possessed a very select collection of trees and shrubs which he greatly admired. He was most successful in propagating many of them in the way, and under the conditions, above described. But this, I think, was in a measure due to his being an amateur in the original and literal sense. *Geo. Syme.*

DAPHNE CNEORUM.

This is one of the very best of hardy plants for growing on raised banks or rockwork, positions for which it is specially adapted on account of its habit, which is spreading and trailing; and when it does well, as may be seen in a few places, it covers a large piece of ground, and clothes the soil with rich beauty, as it flowers most freely, the beautiful pink blossoms being borne on the ends of each shoot. The soil best suited to the wants of this lovely sweet-scented Daphne is that which is light and sharp, and if not naturally of this description, it will be found a good plan, before planting, to dig out a large hole, and in refilling the same to mix in some road-scrappings, or trimmings in which the plants will be found to root freely and flourish. The readiest or surest way of propagating *Daphne cneorum* is by layers, and it is only necessary to bury any of the side-branches to get them to strike; but unless regularly attended to with water during the summer, to keep the ground always moist, it takes two years before the layers are forward enough to be severed from the parent plants, and this should be done just as growth begins in the spring. *J. S.*

USEFUL INVENTIONS.

NEWTON'S METHOD OF ROOF GLAZING.

On a recent visit to Hitchin, we called to inspect some glasshouses erected by Messrs. E. & F. Newton, of Hitchin, on their "patent principle." A great deal of merit is claimed for new systems of glazing, which are often not sufficiently tested to prove their utility; this one, however, seems to differ essentially from any others we have hitherto seen. At the garden of W. T. Lucas, Esq., Foxholes, Hitchin, a greenhouse has been erected about two years; it is placed on the brow of a hill, exposed to the full force of the wind from all points of the compass—a very severe test, and the results are fully satisfactory, inasmuch as no squares have ever slipped or cracked. The gardener, Mr. Sheppard, stated that he had no difficulty in keeping up a night temperature in winter of 65°, although in such an exposed situation. The bars, which are of a special shape, being corrugated below, to give additional strength with lightness, and are constructed to carry

away all water arising from condensation, whether the roof be flat or otherwise.

The method of giving rigidity to the roof by means of corrugated bars of galvanised steel, made entire or otherwise, and strained up by hook-bolts and sliding plate attached to galvanised iron wires, are points of economical constructive arrangement worthy of special regard. There is also a moveable slide on the bars, which permits of a roof-trellis of wire being put up for training Vines, &c. The space between the bottom pane of glass and the wall-plate is about a quarter of an inch in depth, and this space can be closed in cold weather by a movable strip of wood or felt, or it may be left open, and thus afford ventilation to the plants near the glass, and hinder the scorching of the foliage. The house erected in Mr. Newton's garden has no rafters between the two ends; it is extremely strong; the roof is carried by the sash-bars, which are strong enough to carry the glass and workmen also when necessary; no putty is required, and painting the iron-work is optional.

Another novelty we saw at Messrs. Newton's was a method of using roller-blinds for outside shading, which are so arranged that they do not come over the ventilators of the roof, and are worked by means

FIG. 95.—NEWTON'S METHOD OF ROOF-GLAZING.

A, Iron bar; B, Lead-clips; C, Copper springs; D, Glass; E, Condense gutters.

of a pulley from inside the house, attached to a cog-wheel on a roller outside. This house, with the novel roller-blinds, was roofed over with glass and steel as above described, and afforded the greatest amount of light obtainable, and was certainly of cheap but enduring material, the side-walls and staging being of galvanised corrugated iron. Market growers have commenced using this glazing, being convinced of its economy in cost of erection and after-repairs. The use of metal is often objected to by reason of the temperature of the house rising suddenly during outbursts of sunshine, and falling as rapidly in frosty weather; but here there is such a small amount of metal used, that the difficulty of controlling the temperature is reduced to a minimum.

VEGETABLE PRODUCTS IN BARCELONA.

THE following notes from a report on the trade and commerce of Barcelona during the year 1887, may be interesting in view of the great International Exhibition now being held in that city:—

RAISINS.

This fruit is now shipped in considerable quantities to America as well as to England. The better kinds shipped to the United States are now usually packed in layers, Malaga style. Valencias and Malagas are

the produce of the same variety of Vine—the Muscatel—the difference in appearance and flavour being solely due to the processes employed in curing. Whilst Malaga fruit is, when cut, simply exposed to the heat of the sun, the Valencia Grape is dipped for a moment in a boiling alkaline solution, which cuts the skin of the berry—an operation needful, as the sun's rays are less powerful than in Malaga.

The cultivation of raisins in California is yearly of increasing importance, and threatens soon to prove a formidable rival to European growths.

ORANGES.

The very severe frosts in early January and the second week in February almost entirely destroyed the fruit still remaining in the Ribera; nevertheless, in spite of their utter worthlessness large shipments of frozen Oranges were made to the United Kingdom, and, deservedly in many instances, only realised the cost of freight, *Is. 3d. to 1s. 6d.* per case. The *huerta*, or orchard land of Gaudia, being more sheltered, escaped with little or no injury. Mandarins have been much neglected this winter, and there can be no doubt that the extensive plantations lately made, both here and in the Ribera, and which are only now beginning to bear, will prove far too large for the production of Mandarins, the markets for which are restricted; the only remedy for which is the conversion of the area now under Mandarins to the growth of ordinary Oranges, the demand for which is practically unlimited.

TOMATOS.

Perhaps the most noteworthy feature of the year has been the shipment of Tomatos to England. Although this vegetable has always been largely grown here its consumption has been limited to the French and Peninsular markets. This year, however, eight steamers loaded Tomatos for the United Kingdom, chiefly in skeleton cases containing sixteen boxes of 3 kilos each.

At Tabernes, 10 miles north, the specialty is a small Strawberry—not larger than those found wild in English woods; still these again are most highly cultivated. They are cultivated for the Madrid market, their sale ending on San Isidor's Day (May 15). Attempts have been made to introduce finer qualities, such as are grown in England and elsewhere; but slugs and snails, whilst patriotically respecting the native product, attack the aromatic foreign fruit before maturity.

THE SEED TRADE.

HERBS.—The time just passed is that in which, in fair seasons, herb seeds are generally sown. A herb garden forms a part of every kitchen garden having pretensions to size, and in the cropping of which general utility is considered. The demand for herbs is constant in large establishments, and it is the province of the gardener to see that an adequate supply is maintained. But after all, the leading herbs might be confined to some six sorts or so, for not many more are now required for household purposes. If a large collection be grown it will be found that many are rarely required, and the unnecessary sorts employ time and land unprofitably. It is said on reliable authority that "the herbs that retain their ancient popularity are more largely used than ever they were, for the good reason that people have learned to live well, and the gardener is bound to supply quantities of Mint, Thyme, Savory, Basil Borage, Lavender, Tarragon, and Marjoram. A few of the popular herbs, such as Mint, are never grown from seed, or, at all events, those who venture on the pastime might certainly do better. But a certain number—such, for example, as Basil, Borage, Burnet Chervil, Dill, Fennel, Marjoram, Marigold, and some others are grown from seeds, in some cases of necessity, and in others because it is the easiest way of ensuring a crop."

Balm is one of the principal herbs grown in the present day; but it is not nearly so much grown in private gardens as by market gardeners, and that is

probably why it is that it does not find a place in the list of herbs above. "Balm," says one writer, "comes from fertile Arabia—the land also of frankincense and myrrh. From Arabia the Balm-tree was first carried to Judea, as Josephus assures us, by the Queen of Sheba as a present to 'Solomon;' but this was no doubt that fragrant shrub *Amyris*, which yielded the celebrated Balm of Gilead—a precious gum which, at a very early period, the Ishmaelites, or Arabian carriers, trafficked in. The sweet-herb Balm is a native of the South of France, and was introduced to this country in 1573. The large majority of the Balm grown in this country is used for making Balm-tea, a cooling drink much appreciated in some parts of the country. It is also employed in giving flavour to a weak factitious wine. The herb has a weak, roughish, aromatic taste, and a pleasant smell, somewhat of the Lemon kind, and hence it has been called Lemon Balm. Large quantities of seed are annually imported to this country from various parts of the Continent.

Another leading herb is Sweet Basil, a fragrant and favourite herb, having fine aromatic properties, and therefore much employed for flavouring dishes. The leaves in small quantities are sometimes mixed in salads, or used as a flavouring ingredient in soups. Mr. Folkard tells us that "Lord Bacon, in his *Natural History*, states that if Basil is exposed too much to the sun it changes into wild Thyme, although the two herbs seem to have small affinity." Culpepper says that this herb and Rue will never grow together. Gerard says that the smell of Basil is good for the heart and the head. Fennel, which is grown almost entirely in private gardens, is much used in the present day for fish sauces. [A little of it is very good chopped up, and stewed over cooked young Potatoes.] It is a plant of very ancient date, and although probably not a native of this country, it has become naturalised, and grows well on chalky soils. The branches of Fennel were employed by the ancients in the composition of wreaths, worn by victors after the games in the arena. The gladiators mixed this plant with their food, to increase their strength. Evidently the ancients believed that the use of Fennel gave strength to the constitution, and made fat people grow lean. If the Hyssop mentioned in Holy Writ (*Capparis spinosa*) is the same as that grown in the present day—which is perhaps doubtful—then it can lay claim to being a very ancient cultivated plant. *Hyssopus officinalis* is a native of the southern parts of Europe, and was first introduced to this country in 1596, by Gerard. Now, it is mostly employed in mixing with other herbs for flavouring purposes. Sweet Marjoram is one of the principal culinary herbs, and perhaps more largely grown than any. Especially in the northern districts of the country; it is a useful, fragrant herb, held in general esteem, and was introduced to this country about the end of the sixteenth century.

Owing to the flowers of this plant growing in close knotted-like heads, it is also known as Knotted Marjoram. Pot Marjoram is only sparingly grown now. Sage is largely used for flavouring, both in a green and in a dry state. It is a well-known herb in gardens, and though of a hardy perennial character, it does not last above three or four years without degenerating. This aromatic herb is chiefly used with the more strong and oily kinds of food, as a mixture in stuffings and an ingredient in sauces. The leaves are sometimes introduced into cheese. "In mediæval times, the plant, on account of its numerous good properties, obtained the names of *Officinalis Christi*, and was reputed to have been blessed by the Virgin Mary. So wholesome was the herb considered, that the School of Salerno summed up its surpassing merits in the line—

"How can a man die who grows Sage in his garden?"

Probably this saying gave rise to the piece of advice contained in the old English proverb—

"He that would live for aye,
Must eat Sage in May."

Parkinson remarks that "Sage is much used in the

month of May, fasting, with butter and Parsley, and is held of most to conduce to the health of man;" and Turner says that "it restores natural heat, and comforts the vital spirits, and helps the memory, and quickens the senses. It is very healthful to be eaten in May with butter, and also to be drank in ale. (Folkard.)

Of all the herbs Thyme is the only one which furnishes an English seed crop. Large breadths of Thyme are grown in Essex. The plants are cut over every season for seed, and a plantation will last for a long time. The common English Thyme, as it is sometimes called, is a native of Spain and other parts of Southern Europe; indeed, the climate of Spain appears to be well suited to the growth of all kinds of sweet herbs. This popular plant was introduced into this country certainly before the middle of the sixteenth century, but how long previously is not ascertained. It is one of the best known of our sweet herbs. There is a species known as the Lemou Thyme, a trailing evergreen, and remarkable for its smell, which resembles the rind of Lemons, hence its distinctive common name. With the Greeks Thyme was an emblem of activity, and as this virtue is eminently associated with true courage, the ladies of chivalrous times embroidered on the scarves which they presented to their knights the figure of a bee hovering about a spray of Thyme, in order to inculcate the union of the amiable with the active. There is a Thyme known in the seed trade as the French, but it has a much narrower leaf than the common form, and is less aromatic, hence not so valuable for flavouring.

Of all the foregoing, large quantities of seeds are imported from abroad, excepting in the case of Thyme. Such herbs as Rue, Rosemary, Lavender, Tarragon, are in much less demand, though employed in various ways.

It may be stated of herbs generally that they require a warm dryish soil and a sunny situation. Mint may be excluded from this category, because a moist soil suits it best; but, as a rule, herbs will grow as well, and probably better, in a poor than in a rich soil; still, they are not very particular. But the herb garden is not unfrequently placed in some odd corner of the garden, where the plants are left to take care of themselves, instead of being well cultivated, as they deserve to be. Seeds of herbs are generally sown in March and April—in the former month when the weather is favourable, and, as a rule the seeds are sown where the plants are to remain. All that is required is to thin out the plants to the necessary distance apart, and keep the ground free from weeds. Large quantities are cut for drying for winter use. The best time at which Mint, Balm, Thyme, Sage, and other culinary and medicinal herbs can be cut for bunching is just as their flowers are opening. At that period of growth they are found to contain more of the essential oil, on which the flavour depends, than at any other. *Pisum*.

NOTES ON THE NATURAL PRODUCTS OF FLORENCE.

CONSUL-GENERAL COLNAGHT has recently furnished to the Foreign Office an interesting report, from which the following notes are taken. Olives are described as being cultivated on the hills exclusively. The culture, it seems, has been entirely abandoned in the Trans-apennine district, and has decreased in the district of the Mugello on account of the frosts. The plantations of Mulberry trees are important in the Val d'Arno, and in the Val di Nievole, less so in the Mugello and the districts of Pistoia and San Miniato. In the Trans-apennine districts they are extensively grown whenever the climate permits. The trees are generally planted near the farmhouses, or in rows in the fields. In the more recent plantations the "Mottiana," with unlobed leaves, is found. The oldest trees belong to the variety known as "Arancina." The Mulberry is cultivated entirely for its leaves. The trees are generally polled at the end of the autumn, after the second crop of leaves has been gathered for cattle.

Among fruit trees the Giuggiola (*Zizyphus vulgaris*) is often found on the hills, either planted amid the Vines and Olives in rows, or scattered about the farms. Oris-root, the rhizome of *Iris florentina*, is produced in quantity. The plant is grown along the walls which support the terraced fields on nearly all the farms of the lower hills. The Oris is an exhaustive crop, and cannot be grown with other plants. It appears to be cultivated in fields of some extent on very poor soils unsuitable for other growths, rather in the province of Arezzo than in that of Florence. The Oris-root cultivation is said to have increased of late years. It is used in perfumery on account of its violet odour and as an ingredient in tooth-powder. Oris-root of commerce is furnished by two other species of *Iris* besides that mentioned here, namely, *I. germanica* and *I. pallida*. The rhizomes are dug up in August, trimmed, peeled, and dried in the sun, after which the pieces are selected into different qualities. It is exported chiefly from Leghorn, Trieste, and Mogador.

Referring to forest produce it is said the coppice woods grown to supply faggots, of Oak, Horubeam, and Ash, are common only in the Trans-apennine district, and are cut every five or six years. In other districts the Broom and other shrubs are cut for faggots. The southern slopes of the Apennines and of their more important branches in the lower portion of the mountain zone, are still covered, in large part by Chestnut woods, which may, perhaps be roughly estimated as occupying one-third of the wooded area of the province. As Chestnuts form a principal article of food with the labouring classes, and the woods yield a fair profit to their owners, they are kept with some care. There are many varieties of the domestic Chestnut, which differ from each other both as regards the size of the fruit, the quality of the flour obtained from it, as well as their greater or less resistance to cold. Their names differ from province to province, and even from commune to commune. The Marrone is considered the most valuable tree, from the size and quality of its fruit. As it prospers in a mild climate, it is cultivated wherever excessive winter cold does not prohibit its growth. The Chestnut trees are pruned every one or two years; the roots, when exposed, are carefully re-covered with fresh soil, and new plants are substituted when old trees have to be cut down, sometimes by cultivating one or more shoots, at others by grafting a new plant. The Chestnuts are often sold and eaten fresh, but the greater part of the crop is dried and ground into flour. This flour, as is well known, is largely used in Tuscany for making cakes.

HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

POPE'S GARDEN AT TWICKENHAM.—Reference was made in a recent issue of the *Gardeners' Chronicle* to Pope's taste and judgment in matters relating to gardening. In the course of a very delightful article on the translation of Homer in the May number of *Scribner's Magazine* Mr. Austin Dobson makes due reference to Pope's garden. And from this source we learn that when the poet removed to Twickenham in 1717 or 1718 the house in which he was to spend the remainder of his days was simply a tiny building, with two conventional parlours on either side of a stone-paved entrance-hall and bedrooms above to correspond. In front there was a pleasant little lawn sloping to the water; at the back, the house looked upon the highway from London to Hampton Court. On the other side of this road stretched the garden, which was entered from the lawn by a sub-way. This garden was Pope's greatest delight. According to John Searle, his gardener, who published a plan of it in 1745, there were not ten sticks in the ground when his master first took the house."

But with the aid of Bridgeman and Kent, the architect, and the amateur counsels of Lord Peterborough and others, supplemented by his own sleepless ingenuity and genius for landscape-making, Pope managed to twist and twirl his "scanty plot of ground" into a perfect paradise of "artful wildness" and "pleasing intricacy." "I am as busy"—he wrote to Lord Strafford in 1725—"in 3 inches of gardening as any man can be in 3 score acres. . . . I have a theatre, an arcade, a bowling-green, a grove, and what not, in a bit of ground that would have been but a plate of sallet to Nebuchadnezzar." Besides these there were an orangery, an open temple "wholly composed of shells in a rustic manner," a quincunx, and a wilderness. As time went on an obelisk, ringed with Yew and Cedar, and inscribed to "the best of mothers and the most loved of women" terminated the vista. "Pope's villa," we may add, no longer exists in reality, but the ground upon which it once stood is now covered by the residence of Mr. Labouchere, M.P. *H. R.*

RHODODENDRON FALCONERI.—As you have referred in your last issue to *Rhododendron Falconeri*, I think it may interest your readers to know that I have a plant in my conservatory at Stanmore Hall, Middlesex, which is now, and for the first time, in full blossom. It is about 10 feet high, and was raised from seed given to a late relative of mine by Sir Joseph Hooker. *John R. Holland.*

—With reference to Messrs. Howden & Co.'s notice of this plant flowering in Scotland, I beg to say that it was flowered by Standish and Noble (I believe for the first time in Europe) somewhere about 1850, and a wax model, beautifully coloured, was made and deposited in the museum of the Royal Botanic Garden, Regent's Park. The plant was propagated rather largely, and sold freely for some years, but gradually the Sikkims have gone out of cultivation, my own stock of them finally disappearing in that terrible winter of 1860-1861, when the *Araucarias* were killed by hundreds in this part of the country. *Charles Noble, Bagshot.* [We saw recently a fine plant of this species in the wood at Woolverston Park, by the estuary of the Orwell. The leaves were of noble proportions, and the plant was showing for bloom. Mr. Sheppard, the gardener, had not previously known it to flower. *Ed.*]

HELLEBORUS FŒTIDUS.—We grow this *Helleborus* in the borders for its leaves, which are of value in a cut state for the outside fringe of bouquets in vases, where they have a light appearance, drooping as they do in the right direction, and being of a deep green colour. Grown from seed, as ours are, the plants are sturdy, about a foot high, and no mean objects in the herbaceous borders during the winter and early spring months, when the majority of other border plants have not commenced to grow. Ours is a strong soil, in which there is much chalk, which has been artificially mixed with it. *S.*

ILEX HODGENSI AUREA.—Since writing to you recently about the origin of the above-named Golden Holly, I have ascertained that I was in error in supposing that it was identical with the golden sport which originated in Mr. Hodgson's nursery at Clogh-jordan, Co. Tipperary, and which was distributed under the name of *Ilex Lawsoni*. It seems that the plant, the stock of which was recently disposed of at the Lawson Company's sale, differs materially in character from *Ilex Lawsoni*, and that it did originate in the Bangholm nursery. *W. E. Gumbleton.*

POPULARITY OF ALPINE PLANTS.—Three sorts of exhibits were the most popular at the great Whitsuntide Show at Manchester. These were the Roses, the fruit, and the alpinists. The fruit was the only exhibit that had the extra attention of a policeman, and it was almost impossible, at times, to get within seeing distance of the alpinists, to say nothing of smelling proximity to the Roses. It is hoped that the many exhibitors of the aristocratic Orchid and the middle-class stove and greenhouse plants and gorgeous *Rhododendrons* and groups skilfully grouped for effect, will not be offended at our placing the more humble and democratic alpinists in the forefront of popular esteem. Alpinists also seem really better—notwithstanding the hairy Lady's Slipper and many other plants of even doubtful hardness and with yet more doubtful claims to the character of alpinists. But as there was scarcely a collection without one or many of those doubtful plants the jurors exercised a rare discretion in awarding the prizes to the best groups before them, giving due weight to those that were

most true to the alpine type. Perhaps there is no remedy for this until the question of what is an alpine is satisfactorily and authoritatively answered. But the popularity and not the character of alpinists is my present theme and assuredly it was most gratifying to find that the former is a growing quantity. Some critics have characterised the alpinists as weakly, if not weedy this Whitsuntide. Such exacting critics could hardly have passed the winter and spring in England. Those who have done so must be well aware that to have so many alpine plants in such forward condition this May, most of them must have been grown on under glass, and that the latter, however skilfully or sparingly used, tends to draw alpine plants out of form and robs them more or less of their natural charms and beauty. In addition to these large collections there were several smaller lots shown by amateurs and others. There were also many fine hardy plants shown in the collections of hardy herbaceous plants and bulbs exhibited by Mr. Dickson, of Chester, and others, all of which commanded the attention and excited the admiration of the general public. *D. T. F.*

CLEMATIS GEORGE ELLIOTT.—This is one of a batch of fine new varieties of the patens section, raised and distributed by Mr. Charles Noble, Sunningdale Nurseries, Bagshot. It is a vigorous grower, and produces large and finely-formed flowers of a deep violet colour with wine-red bars. As the flowers age the violet pales to mauve, and the red bars are withdrawn to take the form of red tips to the petals. At any stage it is a beautiful variety, and a decided acquisition to the section. *R. D.*

SOUTH AFRICAN PLANTS.—I lately saw a letter sent home from Barberton, South African Republic, Cape of Good Hope, written by Mr. George Thorncroft, who with much kindness offers to send home to any genuine garden amateur—but to amateurs only—seeds of plants which grow out in that locality, and which Mr. Thorncroft thinks have not been largely exported by European collectors, as travellers have seldom crossed the Kaap Valley, a district little known until the discovery of the goldfields there. Mr. Thorncroft mentions that he is no botanist, but that his love for plants has been stimulated by numerous Sunday visits to Kew Gardens when he was a resident in London. Natal he mentions as being very rich in Ferns, and he refers to one noble Tree Fern seen on the road up to Barberton, the stem of which could be encircled only by a man's arms, the tips of the fingers just touching. That would represent a stem 6 feet in circumference. He offers also to collect and press Fern fronds which may be found out there. The Kaap Valley was by the Dutchmen given the reputation of a deadly fever district, but it has been found very healthy, and so luxuriant and rich is the pasturage that oxen employed in labour have to be kept hard at work or they soon become too fat and lazy. Having regard to the state of the labour market at home it seems like a romance to learn that carpenters are receiving from 20s. to 25s. per day, but of course no information is given as to the cost of living. The Kew authorities will be interested to learn that the influence of those gardens has been of so much benefit to a real amateur horticulturist. *A. D.*

A COLONY OF ORCHIS MORIO.—On reading Mr. Webster's note (p. 632) I was induced to take a ramble on the downs here in quest of a handful or two of this *Orchis*, and proceeded to where I had found it in abundance in days gone by, thinking to have a few dozen spikes in a very short time; but I was disappointed, and found only one or two puny specimens where on my last visit they were abundant. However, this was not more than what was to be expected, knowing the vagaries of the species; and going on about half a mile I met with a few straggling spikes, which I supposed to be the fringe of a colony. Such eventually proved to be the case, for the farther I went the more numerous the spikes became, till at last a good handful could be gathered without moving a step, some with as many as fifteen flowers on a spike, and varying in colour from light rose to dark purple, some with the lip densely spotted, others again self-coloured; one, however, is worthy of special notice. The sepals light pink with half-a-dozen parallel green lines, petals of lighter shade, column deep rose, throat nearly white, and lip pale salmon—a grand spike, nearly 1 foot high, with fifteen flowers. There must have been at least

from 20 to 30 acres; but although so numerous this year it is quite possible that next year only a few spikes may be met with. *Orchis ustulata* and *Senecio campestris* were also found, the latter in abundance. *J. Horsfield, Hygesbury.*

CLEMATIS MONTANA.—This fine old species can now be seen to great advantage at Chiswick, where it forms dense wreaths of blossoms on horizontal wires at the point where the path to the great viney leaves the main walk to the south. Mr. Barron has an octagon shaped framework with Clematis, Roses, and other creepers trained against the main supports, and then carried along wires in the form of festoons. Here *C. montana* is indeed a picture, and fully justifies its employment for the purpose. *R. D.*

FRUIT PROSPECTS.—Several flattering accounts have appeared of these, but it is feared the results will not come up to early promise. Apples have bloomed so late that every one has hoped, and is still hoping, the best from them. In not a few localities however, these hopes have wholly vanished, as many of the trees have shown little or no bloom; others are thin, and nearly all are paler than usual. The latter I have noted as a bad sign for years, though what relation there may be between imperfect setting and a lack of colour, it may prove difficult or impossible to explain. Lord Suffield and a few others are full of bloom, and as high-coloured as usual; but those only make the general lack of colour more conspicuous by its absence. Pears are also scant of bloom, though, on the whole, they show better than Apples, for being always white, the lack of substance or colour in them is less apparent, but not a few of the Pears have a delicate look, that bodes indifferently for a full crop. Plums, which one reads of as being white as sheets elsewhere, are, on the whole, a scant crop, Gages, Golden Drops, and nearly all the finer varieties having shown but little bloom. Cherries, Peaches, and bush fruit promise to be the crops of the season. Strawberries are irregular, having lost their leaves in some localities and retained them in others. The result of this loss is also widely different. In some gardens the bloom seems to have perished with the leaves; in others the loss of the major part of the foliage seems hardly to have affected the prospects of a full crop of fruit. *D. T. F.*

PRIMROSES IN RURAL DISTRICTS.—If "R. D." could see the Primroses when in flower here (South Hants) in the woods, he would be convinced that there is no danger of the common Primrose being lost; such a large number of roots are there that it would be decidedly risky to say how many acres could be reasonably planted from this one spot alone, and this in spite of a branch of the Primrose League existing in the neighbourhood. It may be that close to some towns roots often are taken away in great quantities from their natural habitats, but I think far too much fuss is made annually in the papers about the annihilation of Primrose roots. The woods here are mainly composed of Hazel, Beech, and Ash, which are cleared off every ten years, and are intended for supplying wood for hurdles, and hoops for barrels, of which many thousands are made annually. The timber trees are mainly Oak, which stand thinly in the woods. The year following the cutting of the underwood the Primroses spring up plentifully, while the following three or four years, owing to increased vigour following the ingress of more light, the soil becomes covered with them. As the undergrowth gets higher and thicker, the Primroses gradually dwindle down to small plants until the cutting process comes round again, when almost instant rehabilitation takes place. *M.*

REPOTTING LILIES.—At p. 558 we are told that "plants of *Lilium auratum*, &c., which have made a few inches of growth should now be turned out of their pots," and "the old soil shaken off their roots before repotting." I hardly know what effect these lines had upon some Lily growers, but I read them with dismay. As a matter of fact it would be difficult to select a more critical season for such an operation in the whole year than that stated by Mr. Ward as above. With the advent of a "few inches of growth" both the basal and stem roots in healthy bulbs will be most active, therefore to attempt to shake off the old soil at such a time could only be done at a great sacrifice. A worse time could not possibly be selected. Those of your readers who grow Lilies in pots will be aware that the new roots will then be through the ball of earth and against the sides of the pots, therefore to shake off the soil

and repot at that stage would be one of the greatest errors possible in their culture. Where Lilies are grown in pots repotting annually is not necessary. If the plants remain healthy shift into larger pots as required, taking away the drainage and preserving all roots possible. Taken as a whole there is no better time for potting or repotting Lilies than the autumn, and as soon as the flowering is complete and the stems show signs of decay it is at this time that basal root action invariably commences. *E. Jenkins.* [Will Mr. Ward kindly explain? Ed.]

FRUITING CONIFERÆ.—At the May exhibition at the Sydney Gardens, Bath, Mr. Alderman Chaffin produced from his garden, The Grange, Chalcombe, Bath, sprays of *Abies nobilis* and *Cupressus Lawsoniana* bearing male catkins in profusion. The specimen of *Abies nobilis* is 30 feet in height, and was planted twenty-two years ago, and this was the first time the Alderman had known it produce male catkins. They were so profuse that they clustered thickly upon the undersides of the sprays, were about half an inch in length, and of a bright claret-colour. Mr. Chaffin stated that the tree presented to view a remarkable sight, as the catkins were not confined to one part, but distributed generally over it. *Cupressus Lawsoniana*, *Thuopsis borealis*, and *T. Lobbii* were also covered in the same way. Possibly the hot dry summer of last year had something to do with the production of catkins. *R. D.*

TO CARPET THE GROUND UNDER THE BEECH.—The Beech has more than once been likened to a factor who thrives himself, but takes good care that no one under him does so. How far this may be true we have never had a chance of knowing, but this much we do know, that it is a somewhat difficult undertaking to successfully carpet the ground beneath Beech trees. Not long ago a correspondent asked the question, What shrubs would succeed beneath the shade of the Beech?—and in reply we may say that very few will grow in a satisfactory way, yet we have found the following to be fairly well suited for such a position, particularly if the branches of the Beech do not come too near the ground. The St. John's Wort (*Hypericum calycinum*), the two *Vincas*, *V. major* and *V. minor*; *Gaultheria shallon* and *G. repens*, the common Ivy, and *Butcher's Broom* (*Ruscus aculeatus*). The latter plant, if in suitable soil, can eke out an existence even in the densest shade; indeed, I question much whether there is any other shrub in cultivation that could exist under similar conditions to the *Butcher's Broom*. We were perfectly surprised, not a week ago, when trimming in some overgrown *Rhododendron* bushes, to find a plant stuck right in the centre, where it could never for the past half-a-dozen years at least have got a gleam of sunshine, nor even one-half the amount of light generally thought needful. Beneath a dense Yew tree, whose branches swept the turf, we found another plant of the *Butcher's Broom*, not a meagre and ill-foliaged plant either, but one that was quite capable, so far as healthy appearance went, of being planted side by side with some choice *Rhododendrons* just then received from the Knap Hill Nurseries. The *Periwinkles* (*Vincas*), from their procreant and wandering habit of growth, are peculiarly well suited for planting in the shade; which may also be said of the Ivy in its numerous forms, although for the purpose under consideration we have found the common variety to be preferable to any other, and of the most rapid growth. *A. D. Webster.*

WINTER FLOWERING CARNATIONS.—It is sometimes stated that these useful autumn and winter flowering plants do not bloom so freely, and are not generally so useful, as they are represented to be. It may be that some varieties are on the whole better doers, are more profuse of bloom, and show greater persistency than others; but a great deal depends upon the treatment. I have been greatly struck with the usefulness of the winter flowering Carnations by what I saw at Gummingsbury Park during the past winter. Mr. Roberts had a house of plants that began to flower late in October, and they continued to bloom right through the winter. It should be stated that Mr. Roberts keeps the temperature of the Carnation-house during autumn and winter both closer and warmer than is generally recommended for winter blooming Carnations; but this is explainable on the ground that he has to guard against a deadly foe in the form of London fogs; the effects of which are sometimes lamentable, and can only be appreciated by those who have had

to contend with them. It is true that in a close atmosphere the plants are apt to become a little drawn; but it is not altogether a disadvantage; the warmth encourages growth and the production of flowers; while constant cutting corrects to some extent the free development of the plants. A closer atmosphere than is usually recommended occasionally develops greenfly; but the act of fumigating soon gets rid of the pest. Mr. Roberts allows his plants to grow to a larger size than is usually the case. Instead of striking cuttings in early spring, as is generally recommended and practised, he puts in cuttings in October, rooting them in a little heat, and getting them potted off and nicely established in pots by mid-winter; they are wintered in a pit from which frost is excluded, and in spring potted into 32 or 24-sized pots, according to their strength. They are then grown in a cold frame during the summer, and when near blooming time they are taken into the house. The plants that are now blooming will shortly be planted out in the open and form a kind of hedge. Mr. Roberts believes they will make a good growth, and come into flower again at the end of the summer, following the ordinary Carnations and Picotees; and will give him a supply of bloom until those in the house are ready. Mr. Roberts depends upon a few good varieties. Two especially deserve to be named: one is *Brunette*, dark maroon-crimson; the other, *Irma*, pale rosy-pink, both of good dwarf habit, and remarkably free. *R. D.*

A NEW USE FOR COCOA-NUT SHELLS.—Now that the time for thinning out seedlings has come round, it occurs to me that some of the readers of the *Gardeners' Chronicle* may possibly be interested to hear of a device which has saved the lives of many of my young transplanted annuals, even of Poppies and *Eiselscholtzias*, which do not take kindly to being moved. I find that nothing does so well as a protection for newly planted out seedlings as empty Cocoa-nut shells neatly sawn across, so as to form two cups. After being soaked in water these little brown nuts (which are not unsightly, being the colour of the soil) effectually shield the young plants under them from the scorching rays of the sun, and keep them fresh and moist till they get accustomed to their new position. After the first twenty-four hours the covers may be removed, but in very dry weather it is safer to keep them on for another day or so, taking them off at night to give the plants the benefit of the dew, and to prevent their becoming sickly from want of light and air. I may add that I have tried these Cocoa-nut shells with great success to keep the frost from newly planted *Gladiolus* bulbs, and also to cover newly sown seeds, which we are told ought to be kept moist and in the dark till they germinate. True, a good many shells are wanted, but, packing as they do one in another, they take up little room, and can easily be stored when out of use. I have a large stock, having received a boxful from a friend in Tobago, and if any gardener would like to try them, I shall be most happy to make him a present of a couple of dozen, if he will apply to me for them through the editor of the *Gardeners' Chronicle*. *G. Lajard, The Crescent, Leatherhead.*

RUFUS POTATO.—From a cross made a few years ago between *Beauty of Hebron* and *Woodstock Kidney*, I got, with some other excellent kinds, this one, *Rufus*—a large, flattish, red-skinned sort, and not unlike the Vermont *Beauty* we knew pretty well some twelve years since. Coloured Potatoes seldom obtain popularity, the *Vicar of Laleham* being perhaps the most popular of all coloured forms; but *Rufus* is less robust though the more suited for a garden, as it is very superior in quality. Some time since I took some tubers of it from a box where they had laid with the old stock exposed to the air all the winter, and had them cooked, and found when put on to the table a dish which no one could have refused to admit might be *Paterson's Victoria*, so floury and nutty-flavoured were they. Now it is not an easy thing to obtain good Potatoes so late in spring as the middle of April, especially after such a season as was that of last year, and therefore it is worth publishing that in the most readily despised novelties in Potatoes we have some which are first-rate keepers, and of the best quality. *Rufus* does not stand alone in this respect, but I mention it specially because it is so little known. If gentlemen who are proud of that prince of vegetables, a dry eating Potato, would but insist upon their gardeners providing them with diverse varieties frequently, not only would the change prove acceptable, but many a fine eating variety now ignored would soon be brought to light. The great mass

of Potato consumers—those who are dependent upon the supplies of the markets—know little of the interest found in eating home-grown tubers, especially when these comprise a good selection of the best eating kinds in commerce. *A. D.*

SUTTON'S PERFECTION TOMATO AS A WINTER CROPPER.—Last October I planted the side-beds of a Melon-house with this variety. The house was previously got ready by removing the old soil, and washing down the walls, woodwork, &c. The manure which had been under the Melon-bed still retained its heat, and was allowed to remain, and fresh soil and a liberal quantity of lime-rubble was placed thereon. The plants were put out at about 15 inches apart, and trained up the house as single stems. Fruit set at every joint, and by the end of November the stems were nearly at the top of the house. The first ripe fruit was cut on December 25, and from that time onwards we have been able to send to the kitchen on an average two or three good dishes per week from the fifteen plants planted out. This last week, wanting the house for Melons again, I decided to pull them up, and cut from the plants 8 lb. of good fruit. A dish of Tomatos is always much appreciated in the winter, and any gardener having the convenience to grow the plants in winter should not fail to do so. *C. Fluck, Cholmondeley Castle.*

PLANT NOTES.

CYANTHIUS OBLIQUUS.

THERE is an exceptionally fine example of this handsome Cape bulb now in flower in the T range at Kew. It is composed of a mass of large brown bulbs, each larger than a man's fist, and each bearing several broad leathery strap-shaped leaves 2 inches across and a foot or more long. The flowers are on an erect scape 1½ foot or more high, and there are from eight to fourteen flowers in each head. The arrangement of the flowers is in the form of a drooping umbel, similar to what is seen in *Clivea nobilis*. Each flower is 3 inches long, tubular, slightly curved, the tube widening upwards to the mouth, where it is 1 inch across. The colour is soft yellow, with a band of orange, and a tinge of emerald-green near the mouth. The Kew plant bears seven strong flower-scapes. It is considered the strongest example ever seen in England of what is well known to horticulturists as a difficult plant to manage.

ABELIA FLORIBUNDA.

This is much the finest of cultivated *Abelias*, but it is not quite as hardy as *A. rupestris* and *A. triflora*. As a cool greenhouse plant, however, it is as charming as the beautiful *Cantua*, recently so well shown at one of the Royal Horticultural Society's shows from Pendell Court, and it has the advantage over that plant in being much easier to manage. The habit is that of a loose bush, and the flowers are axillary near the ends of the branches. A well flowered specimen with numerous clusters of these flowers which are nearly 3 inches long and bright rose, could not easily be beaten for beauty. Plants of it are now in flower both in the Temperate-house and the greenhouse at Kew.

FAGREA ZEYLANICA

is a large flowered, interesting stove shrub, with the habit of a *Clusia*, and terminal heads of long tubular flowers, not unlike *Lilium longiflorum* in size and shape; but creamy yellow in colour. A plant of it is in flower in the T range at Kew. Grown in a 9-inch pot, and treated liberally in regard to heat and moisture, this species forms a shrub 3 feet high in as many years, and it is certainly attractive enough to be worth including among popular flowering stove plants. In Ceylon it forms bushes 12 feet high. It is figured in the *Bot. Mag.*, t. 6080.

NYMPHLEA "ADELE."

A pretty little Water Lily is now in flower at Kew under the name of *N. Ortigiesiana* var. "Adele." It was obtained through seeds under this name from M. Todaro, of Palermo, but it is certainly not in any

way related to *N. Ortgiesiana*. This latter is a supposed hybrid of Continental origin, but so near *N. Lotus* var. *rubra* as to be scarcely distinguishable from it. *N. "Adele"* is a form of the African *N. stellata*, probably a seedling from the purple-colored variety known as *rosea*. It bears small flowers 3 inches across, with narrow-pointed petals, four green sepals, and a bright yellow cluster of stamens. The leaves are irregularly notched and mottled. They open at about 10 o'clock in the morning, and remain open for the remainder of the day. They are sweet-scented. *W.*

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE ordinary monthly meeting of this Society was held on the 5th inst., at 5, St. Andrew Square, Edinburgh, Mr. Alex. McKinnon, Scone Palace Gardens, in the chair. Mr. Williamson, Tarvit, Cnpar Fife, read a paper on "Flower Shows and Judging thereat." The paper traced briefly the history of flower shows, pointed out their influence on horticultural progress in the past, and while speaking hopefully of their power for good in the future, considered that horticultural societies should bestir themselves.

On the subject of judging, Mr. Williamson held that greater care should be exercised by committees in the selection of men specially qualified to discern the merits of the subjects on which they were appointed to adjudicate. He thought much more accurate and satisfactory awards would be made if a uniform system of judging by marks and points were adopted, and gave tabulated illustrations of his views on the subject as applied to the judging of Grapes and other classes of fruits, vegetables, and flowers. In the discussion which followed considerable divergence of opinion was exhibited, but all agreed in approving the general purpose of the paper, which, as was announced from the chair at the conclusion of the discussion it was the intention of Mr. Williamson to publish in pamphlet form soon, for circulation amongst those interested.

An interesting collection of specimens of greenhouse shrubs was exhibited by Miss Owen, Knockmullen, Gorey, Co. Wicklow. All were cut from the open air, and were perfectly flowered and fully developed, showing how well they were adapted to outdoors decorations in some mild parts of the country. Among others, we noted *Hlaea linearis*, *Grevillea rosmarinifolia*, *Swammerdamia glomerata*, *Choisya ternata*, *Azalea indica*, double flowered varieties; *Raphiolepis*, and several other China and New Holland genera.

A remarkable spike of *Cypripedium Stonei* bearing three flowers of unusual size, came from Mr. A. E. Grant, St. Leonard's Hill, Dunfermline, to which was awarded a Cultural Certificate. Mr. Mark King exhibited a clump of *Scilla verna* in a 6-inch pot, showing extraordinary vigour; and Messrs. Dicksons & Co., a collection of cut blooms of *Calceolaria*, which were much admired.

VEGETABLES.

VARIETIES OF BROCCOLI.

For producing beautiful white close compact heads the Leadsham is the best grown here. The flavour, too, is very mild. I have grown it for the last four years, and so far, for hardness, &c., I find it equal to any other variety I am acquainted with. The leaves fold well over the heads, protecting them from late frosts until they are large enough to be cut. In short, I consider the Leadsham a real gem. Lauder's Late Goshen I have also grown for the same period, and have proved it to be a capital variety, and deserving of extended cultivation. It is also protected by its heart leaves, which on bursting

expose a fine white, solid head of good quality. Knight's Protecting is so well known that its merits need no comment here. Of Gilbert's Victoria I have a good breadth planted, but not having grown this variety before I cannot speak with confidence about it. The plants at present look well, and promise later in the season to furnish a good supply; and should the quality of this variety prove to be better or equal to that of the Leadsham Latest of All—and from the reports of it which have from time to time appeared in the various gardening papers, I have reason to believe it will do so—then it will be without doubt extensively grown. Snow's Winter White cannot be spoken of too highly. We are generally using this variety some weeks before any other is fit for table. *H. Markham, Mereworth Castle.*

NON-WATERING OF CELERY.

The season of 1887 was a difficult one in which to raise creditable supplies of Celery, the drought being chiefly to blame. Hard cold water, such as we have here, is almost as ruinous to many gardens as drought, and is known to many as a most destructive agent, and especially is this the case with Celery. I think that plants are better without such water, and even if the crops were left to themselves they would be better in the end. Last season was the driest in my recollection, and we had no water to spare for outdoor crops; a little was given to the plants when placed in the ground, but none afterwards. There were three successions of Celery—the sorts being chiefly, Incomparable and Major Clarke's Red—amounting to about 1500 heads. The losses were nominal, and consisted of a few which were stunted before being planted; and on March 18 we had still several hundreds of solid well blanched stalks, which had had no protection during the past winter. The whole crop was planted on the surface of the ground in rows, four on each bed. The great depth of the soil and the good mulching afforded at planting time were conducive to the excellence of this Celery. *Scot.*

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JUNE 16. (AVERAGE OF FORTY-FOUR YEARS.)

June 10	60°.1	June 14	60°.6
" 11	60°.2	" 15	60°.7
" 12	60°.4	" 16	60°.9
" 13	60°.5	Mean for the week ...	60°.5

THE PAST WEEK.

The following summary record of the weather for the week ending June 4, is furnished from the Meteorological Office:—

"The weather has varied greatly in different parts of the kingdom. Over the greater part of England it has been generally fine, and at times warm, but over Ireland, Scotland, and the northern districts of England the conditions have been cold and dull, and some heavy falls of rain have occurred. During the latter part of the period a great deal of snow fell in some parts of Scotland.

"The temperature has been 4° below the mean in 'Ireland, N.,' and 'England, N.W.,' and 3° in 'England, E.,' while in Scotland it was from 5° to 7° below; in the other districts, however, it has either equalled or been slightly above its normal value for the time of year. The highest of the maxima (which were generally recorded on June 3 over England, and on various dates in Ireland and Scotland) ranged from 57° to 61° in Scotland, from 64° to 70° in Ireland, and from 66° to 84° over England. The maxima over Scotland on June 2 and 3 were extremely low; at some stations the thermometer on the 3rd did not exceed 38°. The lowest of the minima (registered on somewhat irregular dates) ranged from 35° to 42° over England, Ireland, and the west of Scotland, but in the north and east of Scotland they were as low as from 27° to 29°.

"The rainfall has been considerably more than the mean in the Irish and Scotch districts, and

rather more over the north of England, but less over southern, central, and southern-eastern England.

"Bright sunshine shows a general decrease, especially in the west and north. The percentage of the possible amount of duration ranged from 19 in 'Ireland, S.,' to 44 in 'England, E.,' 49 in 'Scotland, S.,' and 51 in the 'Channel Islands.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

VARIORUM.

ORCHARD PRODUCTS AND WHAT BECOMES OF THEM.—"They are eaten mostly," and if the roofs of the five million or more farmhouses in this country were lifted off some cold winter night, and the happy firesides disclosed, that answer to the inquiry would seem to be final. The orchard products are eaten—devoured by young and old, given to animals, sold in the market, while uncounted millions of windfalls and worm-eaten fruit rot on the ground, and return to the land somewhat of the valu-

able qualities the growing crop has so eagerly taken up. By the census of 1880 the value of the orchard products of the United States was nearly 51,000,000 dols. This includes Apples, Peaches, Pears, &c. The special inquiry now is as to the Apple crop, which is, no doubt, the largest proportion of the above named sum. The export of Apples, dried and in barrels, reaches the very respectable figure of nearly 3,000,000 dols. in value—a boon, and a “boom” of no inconsiderable account to the farmer—while canned fruits exported aggregate a value of more than 500,000 dols. Many years ago, one Buchanan, a Scotchman, came to this country, and a few years later, with characteristic national foresight, devised the plan of sending American Apples to Europe. In 1845 he dispatched five barrels from Boston to Glasgow. The venture paid, and he repeated it until he had an established trade. The steamships then were half the capacity of those in our day, and took twice as many days to make the passage. The Apple export began from Boston; now the export is mainly from Boston and New York, the two cities doing five-sixths of all this business. *Mildura Irrigationist*.

PLUMS IN CHLOROFORM.—The *Pharmaceutical Journal* writes:—“A simple and easy way of keeping Damsons from season to season.—Into a clean and dry 40-oz. stoppered wide-mouthed bottle pour half a drachm of chloroform. Then pack in 1½ lb. of the sound fruits, and introduce the stopper, slightly vaselined. It is desirable to tie in the stopper with twine, or it may be sometimes blown out during warm weather. For a week or two the fruit retains its natural appearance; then drops begin to exude from the surface, which gradually collect into a perfectly clear richly coloured liquid, partially filling the bottle. The fruit at the same time shrinks a little. In this condition it may be preserved without further change for at least a year, and probably for a much longer period. When eaten raw the Damsons have a slight but by no means disagreeable flavour of chloroform, and would be a pleasant addition to the dessert table to be partaken of sparingly, like brandied Cherries. On cooking the chloroform entirely disappears, and the flavour is that of the fresh fruit. The quantities given above are those which have yielded a successful result; and I do not think that a less proportion of chloroform would suffice to keep the fruit. The experiment was, of course, suggested by the well-known inhibitive action of chloroform on the functions of microbes, and several other plans were tried, such as the use of chloroform water in which to keep the Plums, and of vessels vaselined over where the chloroform alone was used. Success, however, was only met with under the conditions given above, though no doubt others might be devised which would have the requisite effect of keeping in the chloroform vapour, and thus paralyzing the yeast cells and septic organisms. Probably other fruit and provision might be preserved in the same way, though in the case of animal food the solvent action of the chloroform upon that might interfere. The great advantage of chloroform over salicylic acid and other fixed antiseptics is that it is got rid of in the act of cooking.” *Indian Agriculturist*.

UTILISING WASTE FRUITS.—In all orchards a certain portion of the crop goes to waste, or for various reasons is not good enough to find a place amongst fair marketable samples. In taking a trip through the orchard and market-garden districts large quantities of fruits of various kinds may be seen lying under certain of the trees, and the condition of much of that fallen fruit attests that it will never be used. The policy of not marketing inferior fruit is unquestionably sound, but all fruit is worth something, and should be turned to useful account. Where Apples are in question they should be picked up at least three or four times a week, and be utilised so that the worms they contain may be destroyed, instead of being allowed to provide for a crop of descendants. Of Apples cider may be made, but if preferred they may be converted into vinegar,

the pulp being given to pigs. Damaged Plums, Cherries, Peaches, Apricots, and any other fruit, may be utilised in precisely the same manner. Vinegar, indeed, is a safe product, and it always commands a price in proportion to its quality. There are growers who systematically give the whole of their damaged fruits to pigs, and who allege that this method of disposal is the most profitable, producing a minimum expenditure of labour, a commodity which is largely in demand. *Mildura Irrigationist*.

Obituary.

MR. WILLIAM THORN.—It is with regret that many gardeners in England and Scotland will read of the death of the amiable late gardener at Newtondon, Kelso, N.B. He was an excellent fruit gardener, but this did not prevent him from taking an active interest in florists' flowers. The Dahlia and Hollyhock were both grown to perfection in the flower borders at Newtondon. He exhibited Dahlias and Hollyhocks successfully half a century ago, but had not exhibited for competition during the last twenty years. He was in his eightieth year, and had retired from active duties for some years.

NOTICES TO CORRESPONDENTS.

CATTELEYA MOSSIE. *Newsham.* A fine, large, attractive flower, above the usual size.

CELEBRY AND DWARF BEANS: *Pontypool.* Your plants are free from disease; the feeble growth, and slight curling and withering, is owing to some defect in culture.

COCKDOACH: *E. H.* Is of foreign origin, and now common in stoves and Orchid-houses. Use phosphorus paste. Simple traps may be made by a large bell-glass with a hole in the top, or inverting a flower-pot, over a saucerful of honey and water, or porter and sugar, sinking the vessel so that the top of the cover is level with the bed or soil.

CORRECTION.—In article entitled “Horticulture at the Glasgow Exhibition,” par. 2, col. 3, p. 690, for “balloon ventilators,” read basal ventilators.

CUT FLOWERS, &c.: *N. N. 1.* The number of bunches or species to be shown is usually stated in the schedule. If that is not stipulated, the prizes will probably go to the choicest collection, irrespective of quantity. 2, Clematis polymorpha and florida are white-flowered, and flower in April.

GOOSEBERRY CATERPILLAR: *Caterpillar.* Remedies for the attacks of these creatures are repeatedly given in our columns. At this season there is nothing better than hand-picking, and shaking the bushes suddenly whilst a sheet is spread underneath. Tie tarred brown paper round the stems. On bushes which are not in bearing you may use hellebore-powder (poison) whilst the leaves are wet from rain or dew. When bushes have been attacked, in the autumn scrape away the soil beneath them to the depth of 2 inches, and burn every particle of it, thus getting rid of both eggs and chrysalids.

NAMES OF PLANTS: *C. Smith.* 1, *Cœlogyne ochracea*; 2, *Maxillaria tenuifolia*; 3, *M. variabilis*; 4, *Viburnum opulus*.—*Pope & Sons.* *Philadelphus coronarius*, single flowered.—*C. H. Perkins.* What you have sent is *Laburnum Adami*, a bastard from *L. vulgare* and *L. purpureum*. At times it brings flowers of a reddish-lilac, and others of a yellowish tint, as in your case, and at the same time there may be flowers of *L. purpureum*. It is therefore of a very sportive nature, and grafts (buds) from it would be the same. The pure yellow flowers of *L. vulgare* sent are evidence of a return to one of the parents.—*R. G. B.* We cannot name from leaves only; send when in fruit. It is probably *Acer plantanoides*.—*C. E. F.* 1, *Saxifraga longifolia*; 2, *S. capillaris*; 3, *S. granulata*.—*J. P.* *Dendrobium moschatum*, *Odontoglossum Coradinei*.—*H. J. C.* *Vicia sepium*.—*A. F. S.* *Menyanthes trifoliata*.—*Fair's Lady of France.* *Saxifraga granulata*, double variety.—*A. M. A.* 6, *Cupressus macrocarpa*; 7, *Spiræa bella*; 8, *S. hypericifolia*.—*Sir C. Strickland.* Ber-

beris *vulgaris var. brachybotrys* and *Jasminum suavisissimum*.—*G. P.* 1, *Spiræa prunifolia*; 4, *S. hypericifolia*; 6, *S. ulmifolia*; others next week.—*T. B.* *Maxillaria tenuifolia*.—*N. S. 1*, *Thuopsis dolabrata*; 2, *Pyrus aria*.—*Jack.* *Calycañthus floridus*.

PEAT: *W. H. T.* The peat is suitable for Ferns, stove herbs, and anything of quick growth, or that is annually repotted and shaken out. It might be suitable for New Holland plants in the youngest stage. With the addition of some fibrous loam and sharp sand it would do admirably for American beds.

PRICES OF ORCHIDS: *Brooker.* *Cattleya Trianeæ* *Leeana* was stated to have cost 250 guineas; *Cypripedium Stonei platyanum* realised over that sum; *Odontoglossum Pescatorei* (excellens) *Knoxii* fetched 165 guineas; *O. crispum apiatum*, 160 guineas; and other *Odontoglossums* over 100 guineas each; *Cypripedium Morganæ*, at New York, about £150; *Saccolabium Heathii*, and a specimen of *S. Harrisonia*, considerably over 100 guineas each, and too many to enumerate similar prices.

ROSE SHOOTS: *L. E.* It is the work of a small caterpillar, which you will find rolled up in the leaf. Pick off all affected leaves and burn them.

STRAWBERRY: *H. S.* Myatt's *Eleanor* (Crystal Palace).

COMMUNICATIONS RECEIVED.—*D. D.* Wakefield Paxton Society.—*F. Moore.*—*W. S.*—*C. Joll.*—*G. W.*—*J. S.*—*W. de H. S.*—*W. K.*—*E. Boaviva.*—*J. R. J.*—*H. E.*—*J. T.*—*T. C. & Sons.*—*G. L.*—*R. Veitch & Sons.*—*W. A. G.*—*Mrs. A. Dixon.*—*G. D.* (thanks).

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

POTATOS.—Old Potatoes unsaleable; new, from Jersey, making 5d. lb.

SEEDS.

LONDON: June 6.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market thinly attended, with but little business doing, quotations for Clover and other seeds are consequently without alteration. The accounts of the growing crops of red seed continue very unfavourable. There is an increased inquiry for both Mustard and Rape seed. Boiling Peas find buyers at full prices. Hemp seed is cheaper, owing to some arrivals. Canary seed keeps dull.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended June 2:—Wheat, 32s.; Barley, 28s. 1d.; Oats, 17s. 1d. For the corresponding week in 1887:—Wheat, 35s. 9d.; Barley, 25s. 9d.; Oats, 16s. 7d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: June 6.—Good supplies of green vegetables, &c., and trade good generally, except for old Potatoes, which are not in demand. Quotations:—Asparagus, 1s. 3d. to 2s. per 100 heads; Gooseberries, 4s. to 5s. per half sieve; Cauliflowers, 3s. to 5s. per tally; Cabbages, 2s. 6d. to 6s. 6d. do.; Spinach, 9d. to 1s. 6d. per sieve; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 4s. to 6s. do.; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. 6d. to 2s. do.; spring Onions, 1s. 6d. to 2s. 6d. do.; Turnip Radishes, 3s. 6d. to 6s. per tally; Mustard and Cress, 2s. per dozen baskets; Rhubarb, 1s. 6d. to 2s. per dozen bundles; Horse-radish, 10d. to 1s. per bundle; Seakale, 1s. 3d. per punnet; Endive, 4d. to 8d. per dozen; Beetroots, 6d. to 9d. do.; Cabbage Lettuces, 4d. to 6d. do.; Cos Lettuces, 1s. 6d. to 2s. per score of 22; foreign Onions, 4s. 6d. to 6s. per bag of 110 lb.; Carrots, 120s. to 140s. per ton; Mangels, 22s. to 24s. do.

STRAITFORD: June 5.—Both trade and supply have been good during the past week. Quotations:—Cabbages, 5s. to 6s. per tally; Onions, Egyptian, 6s. to 7s. 6d. per cwt. bag; Gooseberries, 6s. to 8s. per bushel; Lettuces, 6d. to 1s. per score; Radishes, 4s. per tally; new Carrots, 1s. to 1s. 2d. per bunch; do. Turnips, 8d. to 1s. do.; Onions, 2s. to 3s. per dozen; Cucumbers, 3s. to 6s. do.; Cherries, 5s. per flat; Spinach, 1s. 6d. per bushel; Mint, 2s. per dozen; Parsley, 2s. do.; Rhubarb, 2s. to 2s. 6d. do.; Mushrooms, 9d. per basket; Asparagus, 1s. to 2s. per bunch.

POTATOS.

BOROUGH AND SPITALFIELDS: June 5.—For old Potatoes the demand is confined to best samples, and even these have a downward tendency, although assisted by the slow arrival and advanced prices of new. Quotations:—Old: Regents, 40s. to 85s.; Magnum Bonums, 40s. to 80s.; Champsions, 26s. to 60s.; Dutch Rocks, 50s. to 55s. per ton. New: Malta rounds, 12s. to 13s.; ditto kidneys, 17s. to 19s.; Lisbon rounds, 12s. 6d. to 13s. per cwt.

COLUMBIA AND SPITALFIELDS: June 6.—Quotations:—New: Guernsey kidneys, 34s. to 31s.; Malta do., 18s. to 22s.; do., rounds, 12s. 6d. to 14s. per cwt. Old: Presidents, 30s. to 50s.; Regents, 30s. to 50s.; Champsions, 20s. to 30s.; Victorias, 30s. to 40s.; Magnums, 20s. to 50s.; Imperators, 30s. to 50s. per ton.

Imports.—The imports into London last week consisted of 77 bags and 10,492 boxes from Orotava; 167 cuses, 34 bags, 60 packages, 93 boxes, 51 sacks from Malta; 10,916 boxes from Lisbon, and 50 bags from Hamburg.

TO CAPITALISTS.

A NURSERYMAN, with an OLD-ESTABLISHED FIRST-CLASS BUSINESS, IS IN WANT OF £3000 to £5000,

to further Develop a Largely Increasing Business.—Address, in first instance, Box 32, Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

WANTED, a married Man, as GARDENER, and General Outdoor Servant. Good character indispensable. Good wages and comfortable house.—J. EMPSON, Esq., Beechwood, near Sowerby Bridge.

WANTED, a MARKET GARDENER (Principal or Foreman). An excellent opportunity offers for a thoroughly practical Market Gardener, understanding the routine of Forcing-houses, to obtain a permanent and well-paid engagement.

WANTED, a SECOND GARDENER FOREMAN, where five are kept. To work principally in the Houses under a good Head Gardener. A married man with no children. Wife to open Lodge Gate. 19s. per week.—Apply, stating full particulars, to E. L. R., Hall Place, Cranleigh, Guildford.

WANTED, an UNDER GARDENER, principally for Outside Work. Must be married, and live in lodge. Wife to attend to gate. Wages, 23s., with coals and gas.—J. O. CLARKE, The Poplars, Avenue Road, Regent's Park, N.W.

WANTED, an UNDER GARDENER, in the Suburbs of London.—Married, no children. Wages, 15s. per week, with lodging, coals, and gas. Apply by letter to W., Messrs. Charles Parker & Sons, 8, Birch Lane, London, E.C.

WANTED, a FOREMAN, for the Houses.—Full particulars on applying to Mr. KENNEDY, The Gardens, Downton Hall, Ludlow, Salop.

WANTED, a GENERAL FOREMAN. Not less than 25 years of age. Wages £1 per week, with bothy, &c. None but men of first-class experience need apply.—Mr. HOVELL, The Gardens, Headington Hill, Oxford.

Nursery Foreman Wanted. WANTED, an industrious and steady Man as NURSERY FOREMAN. He must possess a general knowledge of Nursery Stock and must be an expert and successful Budder and Grower of Fruit Trees, and occasionally to act as Salesman. Liberal wages offered to a suitable man.—Apply, stating where last or at present employed, with age, to JNO. JEFFERIES AND SON, Royal Nurseries, Cirencester.

WANTED, Two quick, active young Men, as FIRST and SECOND JOURNEYMEN in Houses where Grapes, Peaches, Cucumbers, Tomatoes, Strawberries, &c., are Grown for Market. State Wages. Bothy and vegetables found.—Mr. J. MILLER, Bury, Gosport.

WANTED, permanently, a young MAN, well up in Outdoor Nursery Work. Quick and good Rose Rudder indispensable.—J. BURRELL, Howe Nurseries, Cambridge.

WANTED, first-class BUDDER and GRAPPER.—Wages required and reference to MARSHALL BROS. AND CO., Baughan Junction, Boggor.

WANTED, a strong active young MAN, with knowledge of Plants and Pleasure Ground Work. Wages, 13s. per week with bothy and vegetables.—J. ALFORD, Pyt House, Tisbury.

WANTED, SIX or EIGHT MEN, experienced at Grape thinning.—JOHN ROCHFORD, Page Green Nurseries, Tottenham, Middlesex.

WANTED, a young MAN, to take charge of Small Nursery, all Glass. Used to Grow for the London Market Trade.—W. C., 42, Wedmore Street, Holloway, London, N.

WANTED, in a Market Nursery, a young MAN, for the Houses. Used to Market Work.—Particulars and wages to L. L., Oaks, Emsworth.

Nursery Hand. WANTED, an active, steady Man, quick, willing, and accustomed to the general work of a Provincial Market Nursery. Wages, 16s. per week, with small cottage, and good garden.—W. W. JOHNSON AND SON, Nurserymen, Boston.

WANTED, a CLERK, at a high-class Country Nursery. A thoroughly efficient man, well up in the Seed and Bulb Trade, and able to prepare Nursery and Seed Catalogue in first-class style. Must be methodical, trustworthy, and a good organizer.—Address full particulars of age, experience, qualifications, where last employed, and wages expected, to NURSERYMAN, R. F. White & Son, 33, Fleet Street, London, E.C.

WANTED, a WAREHOUSEMAN, for the Wholesale Seed Trade, to take entire charge of extensive Grass and Clover Seed Stores. Must be competent to direct a staff of men.—CROSS and DONALDSON, Edinburgh.

Cut Flower Man. WANTED, a MAN, who thoroughly understands Packing and Unpacking Flowers, as Store-keeper at ROBERT GREEN'S Floral Establishment, Crawford Street, Bryanston Square, W. Good wages to a competent man.

GARDENING APPOINTMENTS.

Mr. J. ROERS, late Gardener to B. R. LANGTON, Esq., Langton Hall, Spilsby, has been appointed Head Gardener to R. PHIPPS, Esq., Buckenhill, Bromyard, Worcester.

Mr. GEORGE SMITH, who has been principal Foreman at Mentmore Gardens for the last five years, has been appointed Gardener to E. L. ROWCLIFFE, Esq., Hall Place, Cranleigh, Surrey.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS.

—**JOHN DOWNIE** (of the late firm of Downie & Laird), Sealsman, 144, Princes Street, Edinburgh, has at present on his list a number of **SCOTCH GARDENERS** waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENER (HEAD).—Age 36; varied and practical experience.—Full particulars, **W. PINKERTON**, Castle Hill, Eaglefield Green, Staines.

GARDENER (HEAD).—Age 31; five and a half years Head Gardener to the late Sir Alfred Ryder. Excellent character and testimonials. Abstainer.—**C. HIGGINS**, Wellswood, Torquay.

TO FLOURISTS.—Situation required by thoroughly experienced young Lady. Good references.—**Y. Z.**, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—The stomach and its troubles cause more discomfort and bring more unhappiness than is commonly supposed. The thousand ills that settle there may be prevented or dislodged by the judicious use of these purifying Pills, which act as a sure, gentle, and acid aperient, without annoying the nerves of the most susceptible or irritating the most delicate organization. Holloway's Pills will bestow comfort and confer relief on every headachy, dyspeptic and sickly sufferer, whose tortures make him a burden to himself and a bugbear to his friends. These Pills have long been the popular remedy for a weak stomach, for a disordered liver, or a paralysed digestion, which yield without difficulty to their regulating, purifying, and tonic qualities.

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

On view morning of Sale, and Catalogues had.

The Third and Concluding Portion of the Valuable COLLECTION OF ORCHIDS formed by the late JOHN DAY, Esq., of Tottenham.

MR. J. C. STEVENS begs to announce that he has been favoured with instructions from the Executors of the late John Day, Esq., to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, July 18, at half-past 12 o'clock precisely, the Third and Concluding Portion of his valuable COLLECTION OF ORCHIDS.

For further particulars, see future Advertisement.

Unique and Valuable Water-colour Drawings of ORCHIDS, DRIED FERNS, &c.

MR. J. C. STEVENS has been favoured with instructions from the Executors of the late John Day, Esq., of High Cross, Tottenham, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, July 18, the Unique and Valuable Collection of Life-size WATER-COLOUR DRAWINGS OF ORCHIDS, by Durham, contained in 22 bound volumes, together with 44 loose Drawings, and 5 framed ditto; also the famous Collection of DRIED FERNS.

Tuesday Next.

CATTLEYA BOWRINGIANA. A very fine importation of this most useful winter flowering Orchid. The plants are in splendid condition, and there are many large and well-shaped masses of unusual size. Also

WHITE LÆLIA ANCEPS In extraordinary masses—all the fine white forms are contained in this importation,

CATTLEYA MOSSLE. A very fine lot, just received in very good condition; many nice masses are amongst them.

ODONTOGLOSSUM CITROSUM. A grand importation of this lovely Orchid; the plants are in good condition, and many large pieces are offered.

Also a fine lot of DENDROBIUM DENSIFLORUM, D. FIMBRIATUM, D. NOBILE, in extra good order; LÆLIA PURPURATA, in very fine masses; CYPRIPEDIUM STONETI, CATTLEYA CITRINA, ODONTOGLOSSUM CERVANTESI, &c.

Also two very fine plants of O. MACRANTHUM in flower, and a splendid specimen of CATTLEYA ERNESTI.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. F. Sander to SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, June 19, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Tuesday Next.

DIRECT IMPORTATIONS FOR UNRESERVED SALE. MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., at half-past 12 o'clock precisely a fine importation of VANDA TRICOLOR, V. LOWII, CYPRIPEDIUM STONETI, C. LOWII, C. JAVANICUM, CÆLOGYNE PANDURATA, DENDROBIUM VEITCHIANUM, and other ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next. CATTLEYA MENDELII. MESSRS. PROTHEROE and MORRIS are instructed by R. B. White, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 22, at half-past 12 o'clock precisely, a magnificent importation of CATTLEYA MENDELII, collected by Mr. Mellian in the same district as those sent home last year. They are in capital condition. Also 50 established plants of CATTLEYA MENDELII from last year's importation, all unflowered in this country. From the same importation, extremely fine varieties have already bloomed, one being described in the Garden on June 6 last; together with six semi-established plants of SOBRALIA RUCKERII, and ten plants of SOBRALIA XANTHOLEUCA, described in the Orchid Album.

The Sale will also include a quantity of DENDROBIUM NOBILE, D. FORMOSUM, AERIDES FIELDINGII, and other ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next. EPIDENDRUM WALLISII. ODONTOGLOSSUM HARRYANUM in Bud. ALEXANDRE.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. J. Charlesworth, Heaton, Bradford, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 22, at half-past 12 o'clock precisely, a fine consignment of EPIDENDRUM WALLISII, in extra fine condition. This desirable species grows with tall leafy stems, producing numerous flowers, sepals, and petals, of rich golden-yellow colour, marked with crimson spots; lip white, striped with magenta-purple, flowering in the winter season, and lasting three to five months in perfection.

ODONTOGLOSSUM HARRYANUM, about thirty plants in bud, not previously flowered in this country; also a few semi-established plants. A few ODONTOGLOSSUM ALEXANDRE, in beautiful condition, TO BE SOLD WITHOUT RESERVE.

On view morning of Sale, and Catalogues had.

Monday, June 25. ORCHIDS IN FLOWER.

MESSRS. PROTHEROE and MORRIS desire to announce that their NEXT SPECIAL SALE OF ORCHIDS IN FLOWER will take place as above, for which they will be glad to RECEIVE NOTICE OF ENTRIES AS SOON AS POSSIBLE.

Tuesday and Wednesday, June 26 and 27.

IMPORTANT UNRESERVED SALE of the whole of the well-known COLLECTION OF ESTABLISHED ORCHIDS formed by F. A. Philbrick, Esq., Q.C., who is relinquishing the cultivation of Orchids.

MESSRS. PROTHEROE and MORRIS are favoured with instructions to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY, June 26 and 27, at half-past 12 o'clock precisely, without reserve, the whole of this well-known COLLECTION OF ESTABLISHED ORCHIDS. The plants are in unusually fine condition, and the collection includes probably the grandest lot of Phalaenopsis offered for many years, beside a large number of specimens of hybrid and other Cypripediums. Among the principal items the following may be mentioned:—

- Phalaenopsis amabilis, including picta and many other fine varieties
Dayana (true)
grandiflora, the best Java and Borneo varieties
Schilleriana, including magnifica and other grand forms
casta, three healthy plants
pucorrhoda, fine variety
spicatosissima
tetrapeta
violacea Schroderi
Marie and others
Cypripedium Morganie
Bartete
Leeanum superbum
enanthum superbum
Williamii
vexillarium
Sedeni superbum
barbatum grandiflorum superbum (Henderson's)
politum
selligerum majus
grande
Schroderi
marmorophyllum
Spicerianum magnificum
Veitchii
Lowii superbum
Chantini
punctatum violaceum
Lælia anceps Dawsoniana, with 5 breaks
Hilli Percivalliana
Schroderi virginialis, and other white varieties
litacina
elegans, many fine forms
Saccolabium bellinum
Cymbidium Philbrickianum varieties

The Downdale Collection of Orchids. PRELIMINARY NOTICE. HIGHLY IMPORTANT EIGHT DAYS' SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of ESTABLISHED ORCHIDS, that has ever been submitted to Public Competition.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from Wm. Lee, Esq. (who is Selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL by AUCTION, on the Promises, Downside, Leatherhead, about 1 mile from either of the Leatherhead Railway Stations,

On TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 10, 11, 12, and 13, 1888;

and also on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 21, 25, 26, and 27, 1888.

at half-past 12 o'clock precisely each day, the whole of this most valuable Collection of ESTABLISHED ORCHIDS.

A List of the principal plants appeared in the Gardeners' Chronicle on June 9th last.

Messrs. P. & M. desire to mention that no plants will be sold privately, but that the whole will be submitted to public competition.

The collection may be viewed any day prior to the Sale, by cards, to be obtained of Messrs. PROTHEROE and MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C. The Catalogue is in hand and will shortly be published. Copies can be obtained on application to the Auctioneers.

Important Sale of Specimen STOVE and GREENHOUSE PLANTS.

MESSRS. N. EASTON and SON are instructed by Sir Albert Rolit, M.P., to SELL by AUCTION, at Thwaite House, Cottingham, E. Yorks, on WEDNESDAY and THURSDAY, June 27 and 28, 1888, each day at 1 o'clock prompt, a portion of his STOVE and GREENHOUSE PLANTS, ORCHIDS, &c., comprising, amongst others, fine specimen Palms, Crotons, Ericas, Dipladenias, Allamandas, Stephanotis, and Tree Ferns, all in fine condition.

Catalogues will be ready in due course, and may be had on application to the GARDENER, Thwaite House; or the Auctioneers, Bowl Alley Lane, Hull.

WANTED TO RENT, on Lease, about 2 Acres of LAND with Glass; suitable for growing out flowers.—Address, A., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

CAPITAL INVESTMENT.—For Sale, in Guernsey, the WHOLE or HALF SHARE of first-rate VINERIES, in full working order. Good cottage, charming locality and climate.—A. B. GLATEGUY, Esplanade, Guernsey.

TO LET, a Small NURSERY and FLORIST'S BUSINESS, on the South Coast. Fine position. Doing an increasing trade. Rent £80 a year, no taxes. F., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

To Nurserymen and Others. TO BE LET, on Lease, or the Freehold of NURSERY, 21 Acres of good Land, partly cropped, with good saleable stock, with good Dwelling House, 3 Rooms, plenty of good out-buildings, good water, &c. On main line of rail. Little over 1 hour's ride from London, in the healthiest part of South England. Incoming low, and bargain to anyone wishing to commence Outdoor Nursery Trade. Possession can be had at once, on completion. DELTA, 41, Wellington Street, London, W.C.

TO BE LET, 1 to 10 Acres of GRASS LAND, on Lease for 7, 14, or 21 years. Rent from £3 to £12 per acre, with the option of the purchase of the freehold, within the first 7 years, near the main road, Enfield Highway, about 9 miles from London. Apply, H. MOORE, 59, Bishopsgate Street Within, E.C.

PROTHEROE and MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

FOR SALE, about 12 dozen ALTERNANTHERAS, good plants from single pots, 2s. per dozen. J. DOVEY, Room Hill, Spratton, Northampton.

Carnations, Pinks, and Picotees, from Seeds.

The Flower of the Gods!!! (Dianthus: dios, divine, and anthos, flower).

WILLIAM BAYLOR HARTLAND is offering for Summer Sowings his celebrated strain of the above. His "White Rosette" Clove-scented Carnation is richly perfumed, and snow-white in colour, resembling a "Rosette," and possessing the valuable property of not splitting in the calyx even in the hottest weather, and for buttonhole work and general cutting purposes is unequalled.

- CARNATION, Yellow, Bizarre, and Self, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.
Yellow, Flake, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d.
Hartland's White Rosette, Clove-scented, own savings, per packet, 1s.
Scarlet Ornatid, or floribunda coccinea, large packet, 2s. 6d.; per packet, 6d.; beautiful.
Perpetual, or Tree, for pots, superb, per packet, 1s.
PICOTEE, Yellow and White Grounds, 12 superb varieties, 4s. 6d.; mixed, packet, 1s.
PINK, very choicest, mixed. Some single forms will be found included in this choice strain, and they are very beautiful. Per packet, 1s.
Mrs. SINKINS, selected from a lovely non-splitting form of this well-known plant, and own saving, 1s. and 2s. 6d.

Hartland's Mixed Packets of Oloxinia, Primula, Cineraria, and Calceolaria, are unequalled for quality, 1s. 6d. and 2s. 6d. each.

W. BAYLOR HARTLAND, F.R.H.S., Seedsman, 24, Patrick Street, Cork.

BEAUTIFUL FLOWERS.

I beg to intimate that my Celebrated Collections of CALCEOLARIAS and CINERARIAS are now in Full Flower at my Nursery, BRECHILL, EDINBURGH. Inspection invited.

I have also to offer many thousands of BEDDING PLANTS for the Flower Garden, at moderate prices; also genuine VEGETABLE and FLOWER SEEDS, warranted not bought in by contract.

JOHN DOWNIE

(Of the late Firm of DOWNIE & LAIRD).

80,000 CLEMATIS, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 8-inch pots, 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

WM. CLIBRAN AND SON'S general Plant CATALOGUE for 1888 is now ready, post-free 3d., also CATALOGUE of the best Vegetable and Flower Seeds.

SATURDAY, JUNE 16, 1888.

EARLY ENGLISH GARDENING.

GARDENING, like architecture, may be termed the Art of Necessity; but it is, in addition, like sculpture and painting, the offspring of elegance and luxury. The two first named have much more in common than is generally thought or considered, and to each the observation of the Latin poet is equally applicable:—

"Hinc variae venire artes—labor omnia vincit
Improbis, et duris urgens in rebus egestas."

The desire of protection in the one case, and the intuitive sense of beauty and refining pleasure in the other, are latent germs which action quickly carries into effect. To venture another simile, the three leading principles of architecture and gardening are identical, and resolve themselves into the purpose, the material, and the climate. We do not, however, propose in this place to discuss the principles of gardening, but rather to point out a few of the styles—or what passed as such—the opportunities, and the booklore, in our rapid review of the subject during the sixteenth and seventeenth centuries.

There are very few landmarks in the early history of English gardening; but if a careful inquiry into the manners and customs of the thirteenth and fourteenth centuries has any value, we shall not hesitate to assign its birth to the period of Chaucer; but its dawn cannot be said to have commenced anterior to the accession of Henry VIII. Foreign complications and interneine struggles had reduced the country to a state of semi-barbarity, and men, in the making and unmaking of kings, towns, and countries, had no thought or care for the more ennobling pursuit of literature, or the healthy recreation of gardening; the intercourse with other nations had war for its object, and devastation followed as a natural sequence. The influence of such a

state of things was apparent on all sides, and in every line of life; but perhaps it crippled and stifled no young growth so effectually as it did that of gardening. The number of gardening books and treatises which appeared even at the end of the sixteenth century may be numerically represented by the fingers of one's hand.

Agriculture, as a matter of course, antedated gardening by centuries. The one was primary, the other secondary. The one supplied the most essential ingredients of everyday life, whereas the other was a desirable but not indispensable adjunct. Chaucer, than whom no more delightful word-painter of natural scenery ever lived, is almost the only source whence we can obtain authentic information relative to domestic life in the fourteenth century.

The agricultural population of his time may be divided into four sections, comprising the large landed proprietors, who lived upon and devoted their time to the cultivation of their estates; the smaller proprietors, or freemen, with small patrimonies of their own, or who rented portions of land from the large landlords; the villeins-regardant, or serfs, who, although belonging to the soil, had facilities or opportunities for acquiring a quantity of the soil; and, fourthly, the villeins in gross, or personal slaves, who occasionally became villeins-regardant, and even sometimes acquired the position of "copyholders," or small proprietors. But such movements as these just indicated were greatly accelerated in many ways, particularly by the Wat Tyler insurrection of 1381: and even before his death Chaucer must have witnessed and gloried in the great and irresistible movement by which England once for all rid herself of serfdom and slavery. This movement has an important bearing upon the subject now under consideration. The very natural outcome of it was the more extended cultivation of the herbs which centuries of tradition had declared, if they did not confirm, to be in possession of multitudinous virtues for various diseases and disorders. The fourteenth century may be regarded as the very granary of plant-life. The knowledge of the properties, or supposed properties, of herbs had up till then been in the sole and scattered possession of a large band of empirics; and so when opportunities extended the Englishman apparently resolved to cultivate his own herbs and to prescribe for his own ailments. It is an easy matter to draw an inference from an obvious fact; and, as the first gardening books were "herbals," so it may be accepted as an incontrovertible fact that the earliest phases of gardening resolved themselves into the cultivation of herbs.

Chaucer gives us examples for the four sections to which we have referred. The landlords and their agents are personified in the Franklin and the Reeve, or steward; the freemen are represented by the miller and the yeoman, whilst the unemancipated classes find a prototype in the Ploughman. The story which bears the last name, although undoubtedly not by Chaucer, is sufficiently *à propos* to our subject to consider it in conjunction with the tales that are authentic. The manor-house of Chaucer's period was generally moated, and had, according to its size, one or two courtyards, with gardens, fish-ponds, pigeon-houses, &c.; there was also the rabbit-warren, which supplied both food and fur, and the woodland, whence fuel for the hearth was obtained. The Franklin himself describes a very delightful garden; and, as there is no reason to assume that the picture is purely imaginary, we may infer that the gardens of the fourteenth century were much more delightful places than it is generally thought. The following, with all its quaint form of orthography, is the picture which Chaucer's "Frauklynus" draws:—

"So on a day, right in the morwe tide,
Unto a gardeyn that was ther beside,
In which that they had made her ordinance
Of vitale, and of oher purveance,
They gon and plaie hem all the longe day;
And this was on the sixte morwe of May;

Which May had peynted with his softe schoures
This gardeyn ful of leves and of floures;
And craft of mannes hond so curiously
Arrayed had this gardeyn trefwely.
That never was ther gardeyn of suche pris,
But if it were the verray paradis.
The odour of floures and the fresshe siht,
Wold han y-maked any herte light
That ever was born, but if to gret sikenesse
Or to gret sorwe held it in distresse,
So ful it was of beaute and plesaunce."

But if Chaucer was not the first, he was, at all events, one of the earliest English authors to make distinct allusion to gardens. Mr. W. C. Hazlitt refers to the unpublished fourteenth century MS. in the library of Trinity College, Cambridge, entitled *John the Gardener*, and we heartily share in his regret that this work has never emerged from its manuscript condition. The same industrious author, in referring to the faith in astrology which prevailed in the fifteenth century in governing the operations of the gardener, quotes the title of a tract in the Porkington MS. as follows:—"A Treatise for a man to know which time of the year is best to graft or to plant trees, and also to make a tree to bear all manner of fruits of divers colours and odours, with many other things." Many very quaint and fanciful ideas are expounded in this little tract; and, if we forget for a moment the primitive character and mode of expression in the fifteenth century, we shall be puzzled to determine whether our forefathers managed to extract any grain from so much comparative chaff. One example, quoted by Mr. Hazlitt, may suffice to indicate the general tone of the advice given:—"Also, for to make that a pearl, or a precious stone, or a farthing, or any other manner of thing, be found in an Apple, take an Apple or a Pear, after it has flowered, and somewhat waxen, and thrust in hard at the bud's end, which one thou wilt of these things aforesaid, and let it grow, and mark well the Apple that thou didst put in the thing, whatever it be." The age was an age of marvels, wonders and monstrosities, so that it is not by any means surprising to find in this work full directions for the productions of Cherries without stones, Peaches with kernels like nuts, and Peach trees to bear Pomegranates. The author of *Gleanings in Old Garden Literature* alludes to a picture which one Alexander Neckam draws of a garden in the latter half of the twelfth century, and from this we learn that the cultivated herbs, fruit, and so forth, includes Fennel, Savory, Cresses, Melons, the Cucumber Poppy, Anise, Mustard, White Pepper, Wormwood, Peaches, Pears of St. Regle, Citrons or Lemons, Pearmaines, Oranges, Almonds, Dates, and Figs. The Orange has for many centuries been a great favourite in this country, and so far back as 1290 some were brought over from Spain and presented to Eleanor of Castile, the Queen of Edward I., and very nearly 200 years after this, ten fruits were sold for a silver penny.

The healthy interest which commenced to exhibit itself shortly after the accession of Henry VIII. may be traced to a variety of causes. In the first place, the interecine strife, to which we have already incidentally alluded, no longer obtained, and the rejoicings with which Henry's coronation was followed by three years' comparative tranquillity. War, it is true, loomed in the distance, but as yet the cloud was no bigger than a man's hand. The revival of the art in Italy during the latter part of the thirteenth and the succeeding century undoubtedly had an influence upon the minds of the Englishmen who, in the course of their Continental tour, after leaving college, visited the sunny South of Europe. Crescentius, as Hallam points out, dilated upon horticulture, and gave a long list of herbs, both esculent and medicinal. "His notions about the ornamental department are rather beyond what we should expect . . . and his general arrangements, which are minutely detailed with evident fondness for the subject, would, of course, appear too formal at present, yet less so than those of subsequent times; and though acquainted with what is called the topiary art—that of training or cutting trees into regular

figures—he does not seem to run into its extravagance." (Hallam: *Europe During the Middle Ages*, pt. 2.)

Up to the time of their dissolution, the monasteries of course were the most forward in matters pertaining to the cultivation of choice and rare vegetables and fruit. The fat, lazy, epicurean abbots had a weakness for the good things of life, and their orchards and kitchen gardens were proverbially well-stocked. The art of gardening was as perfect as it could be at that time in their hands, and the advantages which they possessed in this respect over laymen were great and important. As a general rule, however, kitchen gardening was much neglected until Henry VIII. commenced his long and memorable reign. As bearing out this statement, it may be mentioned that a bushel of Onions in the reign of Richard II. were worth about 12s., according to our present computation; whilst, during the last quarter of the fifteenth century, Apples were worth from 1s. to 2s. each. From the fact that Henry VIII. sent his gardener, who was a French priest named Woolf, on a tour on the Continent to obtain a fuller knowledge of the art, and to secure the most popular vegetables, it may be assumed that "bluff King Hal" was deeply impressed with the inferiority of English gardens. Woolf is said to have introduced a number of salads and pot-herbs, varieties of the Apricot, Musk Melon, the Kentish Cherry, and many other things, to the Royal gardens at the palace of Non-such, Surrey, in or about 1524.

The daybreak, which was witnessed in the fourteenth century, only developed itself into the dawn nearly two centuries afterwards. The movement which had like to have been utterly smothered on many occasions was too strong and too important to be overridden by contending influences, however powerful; and the knowledge which had been simply a verbal heirloom for ages became public property in 1563, when the first printed systematical treatise on gardening appeared from the famous press of John Day. The title is as follows:—"A Most Brief and Most Pleasant Treatise, Teachinge howe to Dress, Sowe, and Set a Garden." By Thomas Hill, Londoner." This curious black-letter work is a very extraordinary and amusing book. The author derives all his theoretical explanations from the writings of the ancients. His advice for arrangement and hedging is given on the authorities of Varro, Cato, Palladius, and Columella; but in many instances it is given with evident reservation. Herodotus, as we all know, was very much addicted to the "it is said" principle when compiling certain portions of, and retailing particular stories in, his history; and his example was never better emulated than in the case of Thomas Hill, Londoner. One example may, perhaps, suffice. "Auncient husbandmen affirme that if you burie a speckled tode closed in an earthen pot, in the middle of your garden, that he defendeth the garden from noxious wethers. And in the like manner, it is thought that he maye defend corne from such inconveniences"! Mr. Hill agreed with Varro in advising that a garden should be "near to the cite," that it should be near a "playne field," and that it should lie on a slope, whilst small courses of water through it would prove an additional advantage. The amateur is thus warned:—"beware that thou place not thy garden nere unto a barne, that chaffe and dust of corne, caryed abroad by the wynde, falle not upon the hearbes and so annoyethy garden and hearbes much." He is further cautioned to "avoid ditches and stinckynge puddels." The "consideration and chusing out of good and excellent grounde," and the mode of enclosing and hedging the ground when selected, occupy two chapters of this quaint book. The long but exceedingly interesting list of herbs includes "Borage, Endive, Blete and Spynage, Lettys, Orache, Betes, Colewortes, Cresses, Percely, Sperage, Great Malowes, Savery, Lavage or Alisander, Fenell, Anise, Cummine, Colysander, Mustard Sede, Ceryll, Capers, Dyll, Rue or Herbe Grace, Isope, Mint, Tyme, Organny, Violetes, Roses, Gilly Flowers, Petilius, Basyl, Leekes, Onions, Garlick, Melones, all kindes of

Pompones, Cucumbers, the Gourde, the Artichoke, the Beane of Egypt, Radyshe, Soote Marjoram, Sage, Purselane, Peneroyal, Lylle, Parsnyps, Yealow Carret, the Carnation." The cultural directions are most quaint and amusing; whilst the importance of observing the astrological positions and conjunctions of the planets, as regulating the favourable movements for sowing and planting, are duly urged. This book secured a great popularity, editions appearing in 1568, 1574, 1579, 1586, 1593, and 1608. Hill appears to have been a prolific writer, and quite an universal genius in a small way, for he published

YUCCA FILIFERA, CARR.

THE two illustrations of *Yucca filifera*, represented in our engravings (figs. 97, 100), are copied from photographs of the actual trees—the single headed one in North-eastern Mexico, between Rio Grande and Mexico, and the branching one from near Monterey, Mexico. This singular-looking tree is described as being about 50 feet high, with a trunk 5 feet in diameter.

Yucca filifera of Carrière is now referred to *Yucca baccata* var. *australis*, Engel. *Y. baccata* is well

Yucca, which, in the garden at Antibes, has a trunk more than a yard in circumference, and a height of 6 ynrs, is at this time in flower. The panicle is pendulous, a yard or more in length, and bears many hundreds of white flowers. The plant flowers every year.

HARDY ORCHIS IN FLOWER.

ORCHIS MACULATA when seen in good bold clumps along the margins of dampish woods is certainly a handsome plant—I mean just now, when in full

FIG. 97.—YUCCA FILIFERA: NEAR MONTEREY, MEXICO. THIS TREE IS ABOUT 50 FEET HIGH, WITH A TRUNK OF 5 FEET DIAM.

works on dreams, physiognomy, mysteries, astronomy, arithmetic, and so forth; but Hill is to all intents and purposes the first English writer on gardening. A portrait of him, æt. 42, is prefixed to "Physiognome," (1572). *W. R.*

ESCALLONIA MACRANTHA.—This shrub is in grand flower, growing in a border and trained up the walls of the west front of the Hotel Hfracombe, at Hfracombe; it is also in the pretty grounds in front of same, in bush form; and it may also be found in good condition in many other parts of this picturesque seaside town.

known as the Spanish Bayonet, or Mexican Banana, in consequence of the large, juicy, edible fruit, which is such an important article of food to the Mexicans and Indians, much resembling a Banana in appearance. A figure of the fruit was given in the *Revue Horticole* for 1884, p. 53. The true species is found in Western Texas, New Mexico, to Southern Colorado and Southern California, as well as in Northern Mexico. Though in some positions it forms a thick woody stem, the wood itself is light, soft, and spongy. The leaves contain a coarse strong fibre, which is used in Mexico for making ropes.

We learn from M. Naudin that this enormous

flower. It often sends up the flowering-spike to between 2 and 3 feet in height, with large and conspicuous blooms. No plant is more readily grown than this pretty native Orchid, yet for all this it is seldom found even in positions where it might well take the place of some of our less showy hardy plants. Some years ago I sent a dozen of the biggest plants I could find to a friend at Edinburgh, and they have done well, as I had the chance of observing two years afterwards. The curiously spotted and speckled foliage renders the plant interesting, whether flowers are absent or present.

The *Tracy-blade* (*Lisera ovata*), although not a handsome Orchid, is yet of so great interest to the

botanist, and at present the plant, with its curiously-shaped greenish flowers, may be observed in many of our woods and fields. The contrivances, or rather arrangement, of the flowers so as to escape self-fertilisation, and as first pointed out by Charles Darwin, is both curious and interesting, and well worthy of half an hour's study. Some of the plants in our lake wood at Holwood have beautifully variegated leaves, but this I have before noticed in one or two rocky woodlands on the coast of North Wales.

Well grown specimens of the Tway-blade frequently attain to a height of fully 28 inches, but 14 inches is about the average size under ordinary conditions. The rare little *L. cordata* I have not yet met with, but some fine specimens were sent from the Dublin hills by my kind friend Mr. Burbidge.

Cephalanthera grandiflora.—To-day, for the first time, I met with a bold clump of this rare plant. It was growing along the outskirts of a Beech and Birch wood, shaded from direct sunshine by the trees, the soil a rather stiff loam and leaf-mould. Some of the plants were 1½ foot in height, and bore about eighteen fully developed flowers. The flowers are highly ornamental, being of an unspotted white, except the labellum, which is faintly marked with sulphur, and an inch in length, by fully half an inch in width. It is interesting to know that so rare a native Orchid is yet to be found within a few miles of London. *A. D. Webster.*

NEW OR NOTEWORTHY PLANTS.

ÆRIDES FALCATUM (*Lindl.*) COMPACTUM, *n. var.*

ALL the varieties of *Ærides falcatum* (*Larpenæ*) which I have seen possess a more or less slender habit. The leaves are rather narrow, and of no very thick substance. The inflorescences are lax and many-flowered, and usually dependent.

Messrs. H. Low & Co. have imported a compact variety, with strong, very thick stems, short broad leaves, and short inflorescences. It stands near var. *Leonie*. After a long consideration, I think it best to propose the above-given name for it, after having had on three occasions very rich materials kindly sent at my disposition. *H. G. Rehb. f.*

CYPRIPEDIUM LAWRENCEANUM PLEIOLEUCUM, *n. var.*

Messrs. H. Low & Co., send an interesting *Cypripedium Lawrenceanum*, which has the superior area of the upper sepal white. As the uncommonly scarce coloured radii are very short, it has a distinct appearance in this time of varieties, and may be favourably regarded by the *Cypripedists*. *H. G. Rehb. f.*

THE BOTANICAL GARDENS, OLD TRAFFORD.

VISITORS to the great Whitsun show of the Manchester Botanical and Horticultural Society had an opportunity of seeing something of the change which has taken place in the gardens since the close of the Exhibition last autumn. Old Manchester and Salford is gone; all that remains is a reproduction in stone, instead of wood, of the Cross which stood in Market Sted Lane. The site of these imitative ancient buildings is now a delightful piece of green verdure with a broad walk running east to west, leading to a piece of rockwork, which Mr. Clapham, of Southport, has constructed on a portion of the site of Old Manchester, and which also serve the purpose of shutting out from view a rough corner of the gardens. What was last year popularly known as the "Grand Avenue of Approach"—the main entrance from the Chester Road—is now, as it was last summer, a spacious glass-roofed corridor, occupying the old annexe of previous years, and is now so much extended as to provide ample space for such exhibits as cannot be accommodated in the Exhibition-house; therefore a second tent is no longer necessary. The glass roof of the corridor has been reglazed, the

ground plan has been remodelled, and when the sides and centre of it have been embellished, as they will shortly be, with plants and flowers, the result will be a fine promenade, probably unequaled in any garden in the country. At the Chester Road end of the avenue, what was formerly the entrance-hall to the Exhibition has been converted into a fine dining-room. At the other end, nearest the point where the dome of the Exhibition still rears its head, is a spacious hall, calculated to seat something like 1500 people. A large orchestra has been erected for concerts; and access is had to the corridor by means of swing doors. At the sides of the hall are dressing, smoking, and refreshment rooms.

The Exhibition house has been thoroughly decorated, as its terra-cotta columns and sky-blue tops testify; and the decorations appear to be in harmony with the plants that fill it. A walk round the gardens reveals other changes. A considerable remodelling of the same was necessary; the work was undertaken and carried out satisfactorily by Mr. Clapham. The working of the immense fairy-fountain would have proved too great a strain upon the resources of the Society, and it was broken to pieces and the material employed by Mr. Clapham for other purposes. The hollow formed by the basin of the fountain is now a sunken rock garden, with seats ranged about it. The foundation *débris* of the fountain was employed to form the lower stratum of the rockwork. In constructing this Mr. Clapham imitated as closely as possible the natural dip of the new red sandstone in this locality. It dips from east to west, with thin white beds of white sandstone coming between the layers, sometimes of a few inches in depth, sometimes as much as 4 feet. The base of the rockwork is formed of "Claphamite," a special form of concrete manufactured by Mr. Clapham. It is kept as free as possible, and it is found that the roots of plants grow against and cling to it in the same way as they do to natural rock. Concrete in such formations is found to be considerably cheaper than the employment of blocks of stone, unless stone abounds in the neighbourhood—then it is used. The imitation rock is found to withstand the influence of smoke in places like Manchester better than the natural stone, and it is artificially coloured. The other main features observed in the construction of the rockwork are plenty of root-room and good drainage; all the moisture falls to the back, not to the front, and so there is none of the oozing forth of moisture to the front from crevices, which sometimes disfigures artificial rockeries. The line of Market Sted Lane as it appeared in Old Manchester is maintained, and it runs over the rockwork. In two or three years, when it becomes partially covered with vegetation, it will form a feature of great value in the gardens. Below is an archway, beneath which visitors can walk. Seats are placed there, and it will prove a cool and inviting spot in the hottest weather.

The various houses are filled with plants, all in good condition, and many of the Orchids were in bloom. The rock fernery, enlarged from time to time, and now well furnished, is always a source of great interest to visitors.

In the reconstruction of the gardens, 12,000 yards of new sods were employed. It was Mr. Clapham's desire to cover the walks with red gravel, but the expense was too great. The walks are surfaced with white Derbyshire spar, which is a little trying to the eyes on a hot day, but which will tone down in course of time. The gardens comprise some 16 acres; the walks, which have been considerably extended to furnish dry promenades in damp weather, cover 4 acres; the grass another 4 acres, the remainder being occupied by dwellings, plant-houses, shrubberies, &c.

That the recent exhibition served the purpose of extending a knowledge of the attractions afforded by the gardens is shown by the fact that the increase in subscriptions this year amounts to £3000. Musical promenades will take place three times a week during the summer, and Mr. Findlay will maintain a fine floral display in the houses and grounds, while occa-

sional exhibitions will take place. The Tulip show was held on June 6, a Rose show will be held in July, and there will be two exhibitions of fruit, one in September and the other in October, with a great display of Chrysanthemums later. The desire of the Council is to associate music with flowers; and while combining recreation and pleasure with floral displays, they are never forgetful of the main objects sought to be accomplished by the Society, and these are being steadily and successfully pursued. *R. D.*

KNAURS AND BURRS.

I WAS much interested in the article, on p. 560, having paid some attention to the subject some years ago, the results of my observations being published at the time in the *Proceedings of the Academy of Natural Sciences of Philadelphia*. I suppose, from the explanations of the nature of these organisations, as given in the paper above cited, my views have not been accepted; but after carefully weighing all that is there said, I still think my explanation less mysterious and more in accordance with recognised laws of vegetable growth.

If we start from the beginning, when the knaur is no larger than a pin's head, we shall find that it has nothing to do with the ordinary growth of the tree. It has no relation to a bud, and all speculations founded on "abnormally developed branches," or an "unusual multiplication of adventitious buds" have no foundation in fact. I enclose a few "youngsters" starting from the branch of an Apple tree, and it will be at once seen from their position in relation to the regular bud system of the tree that they can have no possible relation to such buds, and "adventitious buds" as applied to them is a term with absolutely no meaning at all.

To understand their nature we have to go back to the question of the formation of wood and of bark. I suppose it will be conceded that a bark-cell is nothing but a differentiated wood-cell. Wood is formed by the continuous germination during the growing season of daughter-cells from mother-cells. I prefer for popular explanation these popular terms to the more technical ones. In the spring of the year, or rather in early summer—for it is then, as I have shown in another paper, that the actual accession of new wood begins—the abundance of food results in vigorous cells; in a few days these mature and germinate, producing a new generation. These again produce another brood, and so on for—in this climate—about six weeks, during which the whole increase in the diameter of a branch is made. With each succession of brood-cells nutrition diminishes; and it is this fact only that permits us to distinguish the annual layers of wood in the trunks of trees. The earlier cells are larger, and their territory on the map, if we may so term a cross-section, more easily discerned. The last layer of this cell-growth is weaker than the rest, and becomes the back cell. So far, we may admit, that nutrition as suggested in the article cited, has a place in the explanation.

When active life commences in spring this outer layer is thrown off, just as a leaf is thrown off by the generation of cork-cells in the autumn, and the new growth of wood commences and proceeds between the mother-cell holding over from last year, and the layer of bark differentiated from the wood cells, and thrown off as already described. I believe this theory of the formation of wood and bark is essentially my own. It is at least derived from my own experiments. I have taught it for years, and no counter facts have been adduced against it.

The value of a theory is often attested by its ability to clearly explain phenomena that others will not, and this explanation of the formation of wood and bark renders the formation of these knaurs a very simple affair.

The last series of cells formed during the growing season have not individuals all of equal vigour; some have managed to secure more nutrition than others. These refuse to be differentiated; they do not become bark-cells, but continue as wood-cells.

When the new additions to wood-growth commence in due season, this mother-cell does as the rest do, though surrounded by bark-cells; it increases as the other woody tissue does, thickening and enlarging in all directions, and making its annual layer of bark, just as good wood-cells should do. Some of these nodules as they grow will also have stronger cells than others, and make minute knaurs on the surface of parent knaurs. I enclose one divested of bark, which will show this. The little pedicle, or stalk to these knaurs is the first annual increment of wood-cell growth. The pedicle tapers in thickness from year to year. It is not thread-like, but rather funnel-formed. It is only after several years of increment on all sides that it takes rank as an actual knaur. The little ones I send you have been several years in reaching their present stage. Henceforth, their diameter would be proportionately larger. On account of the thin layer of bark formed around the knaur, they do not unite or graft with the main trunk as it grows. A smart blow with the head of an axe will knock out very large ones. They are simply held in position, and derive the moisture or food which supports them chiefly through the little thread or funiculus by which they have departed from the regular system of the parent tree.

There are of course other forms of protuberances resulting from insect or fungus attacks, parasitism, and so on, all of which would require some explanation wholly different from the above in detail, and yet with much of the same principles to start with. But the knaur proper—the excrescence that is not the result of external influences—is easily and, I trust clearly accounted for as I have described. *Thomas Meacham, Philadelphia, U.S.*

A MARKET ORCHARD.

How to utilise the soil to the best purpose beneath fruit trees in market orchards is one of the problems which has to be satisfactorily solved ere any successful effort can be made in fruit farming on a considerable scale. The ordinary farmer may feel content to have grass, because it gives little trouble. Grass is at least the most picturesque ground crop for trees, and gives to fruit culture the purest pastoral aspects. Still it can hardly be conceded that the growing of standard trees on grass is fruit culture in the best sense, and it is far from being fruit gardening. Farming in the abstract may mean utilising land in the simplest way, but gardening certainly signifies the getting out of the soil all that is possible through good culture. Now our metropolitan market gardens present very numerous and generally high-class examples of the way in which areas beneath trees can be profitably utilised. Thus we see in some directions the whole area devoted to flowers, in others flowers and bush fruits are combined, in others all bush fruits are seen, and yet in others—and these are seldom of the higher class—Potatoes and other vegetables are grown. Of course in the latter cases it is endeavoured to grow vegetables only where the trees are young, and have so far made no considerable top covering. The practice, except when limited to salads and dwarf Beans, Spinach, &c., is even then far from being a desirable one, as with such rough and ready cultivation of the ground as the plough gives trees invariably suffer somewhat. Still much depends upon the age of the top trees and of the width apart of the rows in which planted. A combination of bush fruits, Strawberries, Violets, and bulbs is not an unusual one, in the case of somewhat newly planted orchards; but as the bushes beneath spread, and the trees above give considerable cover, the Strawberries and flowers have to give place to the stronger fruits, and in time the entire area is but one mass of bushes below, with dense even rows of standard trees above. Such a combination of cropping is naturally exhaustive, and can endure for any appreciable time on strong land only; and yet it is remarkable for how many years such crops will continue to prove productive and profitable. The saw above and the

knife beneath are liberally used, the soil is annually forked over during the winter, but usually towards its end after the pruning has been completed, and a liberal dressing of manure has been added; the hoe is liberally applied during the summer; and, up to even beyond the twentieth year of planting, such orchards of fruits may be seen in first-rate condition, producing enormous crops of fruit. If so much care and space be given to the bush fruits, it is not to be regarded with surprise, for these often prove the salvation of the grower when top fruits run thin.

Bush fruits are fairly good crops three years out of four, whilst top trees may be relied upon about once in three years on the average. Of course there is always some fruit on them, but such produce is hardly esteemed a crop. Chiefly, however, owing to the great love for flowers which marks our vast population, growers prefer to cultivate these to bush fruits absolutely. The trees give some welcome protection from frosts, from cold winds, and later from scorching sunshine, whilst the soil, as a rule, need hardly be so stiff and holding as is the case when bush fruits are the chief bottom crop.

Amongst growers who favour flowers largely is my neighbour, Mr. E. B. He has four large gardens in diverse parts of the Feltham and Bedfont parishes, comprising, perhaps, on the whole, 120 acres, and in various stages of maturity, as far as the fruit trees and bushes are concerned. In some the trees are quite old; in one especially, a fine garden of some 36 acres, they are comparatively young—in fact, from ten to twelve years planted, and are now getting into their prime. The soil is deep, and holding, yet works fairly well; the garden has a somewhat eastern aspect, but is very flat all the same, and in wet winters rather subject to excess of moisture. Still, trees and bushes are in perfect health, and the whole is about as admirable an example of what a young Middlesex orchard should be as can be found in the county. Apples comprise first early kinds almost exclusively, viz., Early Juliens, and Keswick Codlins; these kinds not only fruit early in the season, and thus, by being early gathered give the trees early relief, but the trees begun to fruit when quite young—an important item in fruit gardening for market. The chief Pear is the Hessele, better known as the Hazel, a poor kind as far as quality is concerned, but a great and steadfast cropper. The trees are handsome, presenting half-standard heads of a drooping form and have been literally covered with bloom. Now and then may be seen a row of Williams' Bon Chrétien, or perhaps of the pillar-like Beurré de Capiaumont, and a few trees of the handsome Beurré Clairgeau have bloomed profusely, but the fruits on standards too commonly fall ere fit to gather, hence they are far from proving profitable.

Beneath the trees run one or perhaps three rows of Gooseberry or Currant bushes, chiefly the former, however. These are laden with prospective fruits, or with bloom, but sparrows have done great injury to the blooms on Gooseberries, and the complaint of similar harm seems prevalent in this district. A variety of Gooseberry not too well known, Merry Monarch, is pointed out which, whilst fruiting wonderfully, has larger blooms, and has not been injured. However, the injury done in other parts is serious, and may presently lead to a determined crusade against the birds. Then throughout the entire length of the intermediate spaces, which extend fully a quarter of a mile, are various flowers. Thus many of these long areas are filled with Wall-flowers, now just finishing; Violets, just divided and replanted; Narcissus, especially the old single poeticus and the double white form, probably the latest of all and perhaps one of the most serviceable. The double white, which is late this year, should give a wealth of flowers for the present season. This Narcissus, which seems to be one of the chief of flowers grown, is replanted every third year, the bulbs being laid after the plough and thus buried fully 4 inches. This deep planting generally results in later bloom and the bulbs are less affected

by drought. Paper-whites, which have got intermixed with the Pheasant-eyes, are cut separately, but are much less in request. Occasionally a few of the long breadths between the tree rows are planted with Coleworts or Lettaces, just to give a change for a year from flowers, but these latter prove by far the bulk of the ground crop. Wallflowers are almost ready to plant out now, as big plants and early heads of bloom are indispensable. Victoria Plum trees, the chief of the stone fruits, have not only bloomed abundantly, but are already literally studded with fruits, and if no more frosts come should stone well. So far there seems every indication of a moderate crop of Apples but plenty of Pears, Plums, and Cherries. *A. D., April, 1888.*

TULIP AND NARCISSUS CULTURE IN HOLLAND.

The Tulip has probably been longer cultivated in Holland than the Hyacinth; and the variety cultivated must have been the early flowering. There is a notice by C. Gesner of a Tulip flowering in the beginning of April, 1559, at Arysburg, in the garden of the learned and ingenious counsellor, John Henry Herwart. In 1611 they first appeared in Provence, in France, in the garden of the celebrated Peiresc. The Dutch merchants, who are fond of flowers, sent to Constantinople for Tulips as soon as they became known. The first Tulips grown in England were sent from Vienna about the end of the sixteenth century. These had been obtained from Constantinople in the first place by Clusius.

There seems to have been plenty of variety in the early-flowering Tulips when Parkinson published the *Paradisus Terrestris*. He gives the names of 15 white varieties, 16 purple, 11 red, and 7 yellow, all forms of *T. præcox*. They seem to have been cultivated in English gardens from year to year, at that time, and our own experience now would lead us to believe that Tulips could be well grown in England, as they do not seem to need such sandy soil as the Hyacinth does. I noticed in travelling from Leiden to Noordwijk that the soil was not so sandy, and resembled the soil that might be found in many parts of England; and the Tulip succeeds better here than it did in some of the gardens near Haarlem. The vigour and health of the plants were most remarkable, considering the very unfavourable season. At any rate, I received the impression that, for Tulip and Narcissus culture, the balance was in favour of a less sandy soil than the Hyacinth delights in. The Tulip bulbs are planted closer than those of the Hyacinth, but not much; and such vigorous growth as they have could not be obtained without plenty of rich manure; and the prices they obtain are not such as is likely to yield a large margin for profit. The bulbs cannot be cut up for propagating the same way as the Hyacinths, but must be increased by the slower process of offsets. The Tulips grown in quantity are those most popular in England.

The Duc van Thol varieties are grown in most gardens, and are the first to bloom. The most popular varieties are La Reine or Rosamundi, blush; Yellow Prince, White Pottebakker, Proserpine, purplish-rose; Joost van Vondel, dark red, white flame; Krizerskroon—this was very fine—large crimson flowers with yellow margin; Vermillion Brilliant; Wouwerman, purple, large flowers.

Amongst varieties not plentiful or not so well known I noted, as very desirable varieties to cultivate in England, the following:—Dussert, scarlet; Rembrandt, also scarlet; Lac Backhuis, lake, tipped white; Gladstone, carmine—large, well formed flowers; Purple Crown Improved (variegated foliage) has well formed flowers of a blood colour; Jan Lincken, rosy-carmine, marked with white on the back of the petals; Fisser, best dark blood-red, large size, and fine form.

NARCISSUS.

The Polyanthus Narcissus had suffered very much from frost, both as regards the leaf and flowers, so

that it was not possible to decide on the respective merits of the different varieties. The ordinary forms of *Narcissus* had not suffered from frost, and many of them were well in flower with the *Ilyacynthos*. *N. princeps*, *N. Horsfieldii*, *N. obvallaris*, *N. spurius*, *N. "Golden Spur"*, *N. maximus*, are grown in very large quantities. Of Emperor and Empress there were good beds in the leading nurseries; while Sir Watkin and a few others of lesser fame were being rapidly increased. The bulbs are in some cases allowed to remain as many as three years in the ground without being removed, and the third year they make splendid growth, with immense leaves and large handsome flowers.

There is a very large collection of choice varieties of *Narcissus* in the nursery of M. De Graaf, at Leyden, and the popular varieties were grown in quantity. I had not sufficient time to make notes, but this is the less to be regretted as the best of M. De Graaf's seedlings have been exhibited in London during the season by Messrs. P. Barr & Son, of King Street, Covent Garden. Madame De Graaf, exhibited at the Crystal Palace on May 12, has large creamy-white flowers, as large as an ordinary *Horsefieldii*. It is well figured in *Gardeners' Chronicle*, vol. ii., 3rd series, p. 111. *Glory of Leyden*, also raised by M. De Graaf from the same parentage, is also a remarkable variety. So also is *Gloria Mundi*, an incomparabilis variety of great beauty, which was, I believe, also raised in the great Leyden nursery. I saw some beds of seedlings in flower and other new varieties being propagated which will some day become famous. I was also in time to see the last blooms of the *Hippeastrums*: they were growing in a hothouse, the temperature of which was similar to that I have recommended in the *Gardeners' Chronicle*. The pots containing the plants were plunged over the rims in spent tanner's bark, and better or more healthy vigorous plants no one could wish for. The few flowers I saw were well formed and distinct in colour. Immense quantities of hardy plants are grown in this nursery, the *Hellebores* being represented by a very large collection. The demand for hardy plants of all kinds is very large, but it would need to increase, as the supply of plants in all the leading nurseries at home and abroad is very large now, and seems to increase year by year. *James Douglas*.

SAXIFRAGES.

The plant represented by our little woodcut (fig. 98), though only an improved form of the well known *S. cotyledon*, is a great advance on that species, and is certainly one of the most popular of this large genus. Dr. Engler in his monograph makes *Euzoonia* his Section 13, which includes *lingulata*, *Aizoon*, *cristata* and many other well known species. The forms of *Aizoon* in gardens now-a-days are legion; many of them are really very beautiful, and all are useful for rockeries, and other similar phases of alpine gardening. *S. florulenta* is a species introduced in large quantities some few years ago, and which baffled all the efforts of cultivators to keep it in a thriving state for any length of time. The last piece we saw, and which was probably the last of the importation, was eking out a miserable existence on the roof of an outhouse at Brosely, a place famed for rare plants, many of them being in excellent condition. *S. longifolia*, the nearest ally to the above, is, with the exception of *pyramidalis*, the most beautiful of this large section. It may be cultivated with the greatest ease where it can be accommodated in the niches of rocks and large stones, where its roots can penetrate and keep themselves cool in summer. When *S. longifolia* flowers it dies, but if carefully looked after it usually forms good seeds, and this is by far the easiest way to establish it in our gardens. We find it safest, too, to sow the seeds as soon as we gather them, and the following season we find the seedlings ready to plant out. In the course of three or four years the rosettes will have attained a good size, when these again will flower, and the same process will have to be gone through again. *S. Hostii* comes next; it is a fairly common plant in collections, and noted for its prettily marked flowers. It is often grown under the name of *elator*, *rhaetica* and *tristis*,

being slight varieties. The most handsome of the *Hostiis*, however, is one called *Macnabiana*; it is said to be a hybrid between *Hostii* and *cotyledon*, but after long and close examination I have quite failed to detect any *cotyledon* blood whatever, and have come to the conclusion that it is simply an improved garden form of *Hostii*, none the less beautiful because it may not claim a hybrid parentage. The flowers are larger, and the bright purple spots larger and more numerous than in any of the plants of this section. A most useful plant for pot culture, and a lovely subject for greenhouse and conservatory. *Cristata* and *altissima* are closely allied to *Aizoon*, though perhaps distinct enough for a specific place. *S. lantoscana*, a form of *S. lingulata*, was figured and described in these pages for January 22, 1881. Other forms are *atalonica*, *australis*, and *cochlearis*—distinct varieties, all useful for variety. *S. pyramidalis* is largely grown now for Covent Garden Market, in small pots, and the rapidity with which it finds a market tells more forcibly than we can how it is appreciated by the public. It produces numerous offsets from the base of the large rosettes, and the strongest of these are chosen for the next year's supply, simply potting them off in good rich

FIG. 98.—SAXIFRAGA PYRAMIDALIS.

soil, and keeping them in cool frames, free from drip. In spring, when sending up their flower-stems, the liberal use of liquid manure will greatly improve the plants. *D.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM CAPILLIPES.

THIS old though beautiful *Dendrobe* deserves more attention than has hitherto been given to it. Considering the number of plants that have been imported by various firms, and the low price at which they are offered, it should soon become generally cultivated. The bulb resembles a pigmy form of *D. albo-sanguineum*, and usually attains a height of 5 inches, and produces from the upper nodes short spikes of bright yellow flowers. It is of easy culture, and succeeds best upon a block. Some grand examples of this species are now flowering at the Vineyard and Nurseries, Garston, Liverpool. *F. Ashton*.

DENDROBIUM HIRCOGLOSSUM.

This is a small-growing but floriferous *Dendrobe*, very nearly allied to the Chinese species, *D. aduncum*. The delicately coloured flowers are a little over an inch in diameter, and are produced from the upper nodes of the old pseudobulbs. The sepals and

petals are of a pale rose colour, the curious, somewhat saccate lip being of a lighter shade. The most conspicuous part of the flower is the apex of the column, which is very deep purple—almost black. The species was discovered in Malacca, and was introduced by Mr. F. Sander; a description by Professor Reichenbach appeared in the *Gardeners' Chronicle* for October 16, 1886. It is certainly one of the prettiest of the smaller growing *Dendrobes*, and is flowering at the present time in the Kew collection. It should be grown in a shallow basket of peat fibre and moss, near the glass in the warmest house.

BLETIA HYACINTHINA.

Notwithstanding the plethora of *Orchid* bloom at the present time, there is no inmate of the *Orchid-houses* which does more to heighten the general effect than this old favourite. The colour of the flowers, varying from light rosy-purple to quite dark purple, is always bright, and shows up against the long, graceful, light green leaves with great distinctness. The freedom with which it blooms well repays the small amount of attention it requires. After flowering it is advisable to remove the plant out-of-doors, and by plunging the pots in ashes there will be less trouble in keeping them sufficiently moist at the roots. As winter approaches they should, if space will allow, be placed in a cold frame, where they may stay (requiring little or no water) until early spring. When the growing points appear through the soil any plants that require it should be repotted, and the whole stood in a cool house; ample waterings will then be required. This *Orchid* thrives in a compost of loam, sand, and leaf-soil.

EPIDENDRUM BICORNUTUM.

This *Orchid*, although better known under the above name, has, along with a few other species, been separated by Bentham into a fresh genus—*Diacrium*. The pseudobulbs are cylindrical in shape, and hollow; they are said frequently to be occupied by the native ants, which enter by a small hole at the base of each, formed, apparently, by the contraction of the sides. The flowers are pure white, with a few spots of crimson on the lip. A very distinct and superior form is now in flower in the warm *Orchid-house* at Kew. The *Orchid Growers' Manual* states that "spikes of sometimes ten or twelve flowers are produced;" the plant under notice has, however, no fewer than twenty-two open and unopened flowers on one spike. The difference in habit, too, is very marked; usually the leaves are four or five in number, and situated at the apex of the pseudobulb, but in this instance they are distributed alternately at each node down to the base. Professor Reichenbach, when at Kew, was struck by the distinct character of this plant.

Considering the great beauty of this *Orchid*, it is a pity that there is any difficulty in keeping it in a continuously healthy condition. To attain the best success it must be grown in the warmest and moistest position available—if possible, suspended over a water tank. *W. B.*

CYPRIPEDIUM BELLATULEM.

We now give a figure (fig. 99—see p. 747) of this new species of *Cypripedium*, of which a full description, by Professor H. G. Reichenbach, was given in our issue for May 26 last. The plant was shown by Messrs. H. Low & Co., the importers, at the meeting of the Royal Horticultural Society on May 22, being then Certified. It was again shown by the same nurserymen on the 12th inst. at the Society's meeting, and in some variety, a rose-tinted specimen obtaining a First-class Certificate. The flowers are very varied in their marking, and on opening have a greenish tinge.

ROYAL APPOINTMENT.—Messrs. E. H. Krelage & Son, Haarlem, inform us that they have received from His Majesty the King of the Netherlands the warrant of appointment as Royal nursery and seedsmen.

GLADIOLUS THE BRIDE.

THERE are few plants probably among so-called hardy bulbous plants that can equal, much less surpass this one in its chaste and lovely blossoms. The variety of circumstances to which it adapts itself in so charming a manner are far too numerous to give in detail, but may be summed up in one brief passage, that careful and judicious workers cannot misplace it in any floral arrangement. Its picturesque and pure white blossoms may be brought into pleasing contrast with so many other flowers that it is really an indispensable article with the florist. Some years ago, in a note to the *Gardeners' Chronicle* respecting this plant, I referred to its adaptability for early forcing, by which I meant, not forcing as may be generally understood with respect to early Grapes, Peaches, and certain vegetables, or the like; but by bringing it on in gentle heat, say, for example, a temperature of 50° to 55° up to the middle of April. I further suggested that, consequent upon its being so nearly akin to evergreen, the earliest flowered batches might, with careful treatment, be made to flower twice in the year. I stated my intention of testing this, with the hope that some others might do likewise, and in turn record the result. Since that time I have carefully tested them with a view to bring about the above result, but without success. The earliest batches, say of this year are, if allowed to remain undisturbed, ready to start into active growth by the middle of August ensuing; they look promising enough at first, but after a reasonable time they fail to gain the necessary strength requisite, and ultimately only produce a considerably weakened growth. This is perhaps due to the hasty manner in which they are made to flower in a foreign temperature; and consequently in a proportionate degree does the maturation of the new corms for the next season's flowering suffer. Such is my experience of this plant when used for producing flowers prior and up to the season of Easter. After this time they may be had without undue forcing.

Of this very useful plant the question is often raised, "Is it perfectly hardy?" and my reply is, that those who value their stock will always protect it from either winter or spring frosts. It is not sufficient because this or that plant squeezes through a severe winter, that it should be pronounced "hardy," as is too often the case; it is rather a question of what follows this extreme test, and whether it is generally more useful to the majority; for instance, *Lapageria alba* may just get through a winter, but will it produce a vine the following summer fifteen or twenty feet long, and produce a score of its waxy blossoms in a raceme? If not, where is the use of exposing it to such hardships? Again, take *Primula obconica*, which in certain favoured localities may be hardy, but can it under these conditions be expected to yield the endless quantities of blossoms which come in such rich profusion when grown as a greenhouse plant during the winter months? The answer is obvious to all; and so, in a corresponding degree, does this affect the *Gladiolus*; and those who are anxious of preserving it to the utmost, cannot do better than plant it out in a cold frame in prepared soil; any light, fairly rich sandy loam suits it admirably, in a sunny position, where the lights may be taken off entirely when spring frosts are gone, till they have a good stock of it; and after it has stood a couple of years undisturbed, the crop will be a surprising one to those unaware of its reproductive capabilities. Given good corms for planting in the first instance, and with the treatment I have just advocated, one might take out at the end of two years from eight to twelve corms for every one planted, beside being enabled to cut a goodly quantity of flowers meanwhile; it is quite a common occurrence with frame culture to take out five and six as the result of one, while an ordinary average return is seldom below three.

Spring frosts are very destructive to this plant, and if planted on cold, clayey soils, so much the

worse; the chief points, therefore, are, a light, warm soil, sunny position, complete protection from spring frosts, and, above all, let wireworm be kept away, or they will soon riddle them with holes. It may not be generally known that there are two white forms of this plant—*Colvillei* The Bride, and *Colvillei alba*; the first has pure white flowers, and sulphur-white anthers, while the latter has flowers not quite so pure, and violet-coloured anthers; notwithstanding which, they are frequently regarded as synonymous in many bulb catalogues. *E. Jenkins.*

FLORISTS' FLOWERS.

NEW GOLD-LACED POLYANTHUS.

THERE reached me some days ago from Mr. A. Mottershead, Brockhurst, Didsbury, some examples of new gold-laced Polyanthus, which he thought would interest me. Black Knight (First-class Certificate, Manchester, 1888), which might be generally described as in the way of *Cheshire Favourite*, good well-formed pip, black ground, fine and regular lacing of pure gold, slightly darker in the centre; promising to make a valuable exhibition variety. Regina, a very fine variety of the style of George

FIG. 99.—*CYPRIPEDIUM BELLATULUM*: PURPLISH-BROWN SPOTS ON A WHITE GROUND. (SEE P. 736).

IV., ground colour black-red; fine clear deep golden centre, lacing good; full-sized pip, of fine form. Black Cap (First-class Certificate, Manchester, 1888), black ground, deep golden centre, pure and solid, the lacing bright gold, finely laid on; good well-formed pip. Mrs. F. D. Horner (First-class Certificate, Manchester, 1888), also a fine and promising black ground, good clear golden centre, and regular lacing, finely formed pip; first-rate. Ensign, dark red ground, good colour, and fine lacing; and Seedling No. 1, black ground, and also a promising flower. All these, I believe, are seedlings raised by Mr. Mottershead, and that three of these should be deemed worthy of Certificates at Manchester, where the properties of gold-laced Polyanthuses are fully understood, attests to their high-class quality. *R. D.*

THE HOLLYHOCK.

All plants should be well established out-of-doors by the middle of June, and the permanent stakes placed to them, in order that no future disturbance of the plants shall take place. Driving a stout stake into the ground close to the stem of a plant may do harm at a later date, by disturbing and injuring the roots. As they increase in growth see that the stems are not too firmly tied to the sticks, but sufficiently so to prevent them from swaying about. The side growths will soon push out, and as these make excellent cuttings, they may be utilised for that purpose. A lateral growth will have one, two, or three eyes at the base of the leaves nearest the main

stem. At the base of the other leaves there will be flower-buds, but every one of the leaf-buds may be used to produce a plant. They are merely cut off with about an inch of stem attached to them, and planted in small pots. It is not necessary to plunge them in bottom-heat; they soon root in cold frames if shaded from the sun. Any growth from the base of the main stems not needed for flowering may also be used for cuttings. With careful management a large stock of plants can be obtained. During the summer months I dip all the cuttings overhead in soapy water, in which some flowers of sulphur has been dissolved, and to which some tobacco-water has been added. The last-named ingredient will destroy any red-spider that may be on the leaves; soap and sulphur alone will destroy thrips, green-fly, and mildew, but is not certain to kill "spider."

The incipient stages of the Hollyhock fungus may be checked, and the pest destroyed, by the use of sulphur and soapy-water. The old-established plants ought to be syringed daily, directing the force of the water underneath the leaves. I may add, the plant is a gross feeder, and luxuriates in a rich, deep soil, with plenty of manure-water supplied during growth.

THE DAHLIA.

If the plants are backward there need be no hurry to plant them out. I like to have good substantial plants in 6 or 7-inch pots; and there is no need to plant them out before the second or third week in June. As I write now there is a dry east wind blowing; and such tender plants as Dahlias fully exposed to it might be much injured. They should receive much the same kind of treatment as Hollyhocks, but being more tender they cannot be planted out so early, and to give them a good start I dig out a hole large enough to hold about two spadefuls of prepared soil, and in this the Dahlias are planted. I also prefer to put in the sticks at that time. A little decayed manure placed on the soil round each plant prevents much evaporation of moisture, but retains heat about the roots causing a more rapid and steady growth. I well remember the difficulty we had in a bleak part of the lowlands of Scotland near the Cheviot Hills, to get in the Dahlia blooms for exhibition by the middle of September. It could not be successfully accomplished except by growing the plants on in frames and planting them out late. Early autumn frosts were also a source of anxiety. I have seen white frosts by the second week in September, and the flowers had, of course, to be protected at that date.

THE ANEMONE.

I have grown this year a large number of named varieties of the best double forms, and they have greatly improved on what they were last year in vigour of constitution. Mr. Barrant me a number of selected forms from the Riviera—single, of course; but they were very pretty, of the fulgens form, and of lilac-purple hues. The double varieties are rich in brilliant scarlet, and also quieter shades of pale rose, cream, slate, and blue, with many intermediate shades, and are equally pretty. They began to go out of bloom just as the leaves showed signs of decay, and in two weeks it will be time to take them up and store them away in a dry place.

THE PILEUS.

This is one of the sweetest hardy plants in cultivation for those who do not care to be troubled with glass-houses or frames in their garden. I do not know anything in the flower garden more easy of cultivation, or that can be propagated with greater facility. I have in previous numbers recommended propagating cuttings in small pots over a hotbed early in the year. These cuttings produce one strong spike, which will flower very strongly in 5 or 6-inch pots, and are excellent for greenhouse decoration. We have treated the cuttings in a more simple manner this year. They were taken off about the end of May when they had grown about 6 inches high, and planted out-of-doors in a shady border; the shoots were slipped off with a heel, and they are

already established and growing; every plant of them will form a good flowering specimen for next year. They may be planted either in October or early in March where they are to flower. Let them stand 18 inches apart in deep rich soil. After planting cover the surface with decayed frame manure, and if this is objectionable, use cocoa-fibre refuse, a material excellent for retaining moisture in the soil, and quite as good as manure where frost has to be kept out.

THE PINK.

This sweet little plant is not likely this year to throw its delicate perfume round the garden before the first week in July. The growth is healthy and quite strong, proving conclusively that cold weather is not in the least injurious to it. The cold dry east winds pinch up and cripple the Carnation and Picotee, but will not in the least injure the Pink. I noticed years ago how easy it is to grow Pinks well in Scotland when Carnations and Picotees succumb to the weather. The propagation of the Pink by pipings must be attended to from the middle to the end of this month, and they will take best if the work of propagation is performed in showery weather. At that time they may be planted in a shady place out-of-doors, but if the weather continues dry and hot they will succeed better in a frame or under handlight. They should be shaded from the sun until they have formed roots. The aim of the cultivator is to produce good strong plants for setting out in beds about the end of September or early in October.

THE FORCINO PINKS

that were propagated from pipings in the month of April will now be ready to plant out and grow into substantial clumps, which by the end of September may be dug and potted into 6-inch pots for forcing the following season. The old plants that were forced during the past season make excellent subjects to plant in the herbaceous borders, where they speedily form large plants, which will give fifty or more fine blooms next season. Let them have good rich soil to grow in. *J. Douglas.*

THE ALPINE GARDEN.

LITHOSPERMUM PROSTRATUM.

This, as its specific name implies, is a plant of low growth, rising only a few inches in height, but when in bloom it is a striking object, its blue flowers rivaling the Gentians in the intensity of their hue. These are about the size and shape of those of the well-known Forget-me-not, and are borne, on healthy plants, in great profusion. Unfortunately this *Lithospermum* is what gardeners term "miffy," and yet now and then it is met with growing in the freest manner, but this is in situations where the soil and position are both suitable. Where it does best with us is in a sheltered place, fully exposed to the sun, where the ground is loose and sandy, and there we have a plant quite 3 feet across. The shoots are hard and wiry, but they will root readily if layered in sandy loam or peat, or cuttings may be struck from the young, half-ripened wood if put in and kept close and shaded under a hand-light or bell-glass in the open. *J. S.*

CAMPANULA ALLIONI.

Like many other rare alpine, this plant is flowering this year more freely than usual. It is flowering best under peculiar conditions, which I think it as well to mention. We growers of alpine are generally so much afraid of having plants of delicate growth smothered by their coarser neighbours that we are liable to run into the opposite extreme of leaving them too bare. The straggling habit of *Campanula Allioni* would suggest an inclination to run amongst dwarf herbage. I observe that in one of my raised borders there is a compact growth of *Primula integrifolia* which has grown from seed, and covers the ground very thickly. *C. Allioni* has run

into this and has pushed a dozen detached shoots through it, every one of which bears one or more flowers. One shoot is three-flowered—a thing I never saw before in this garden. My chief grievance against *C. Allioni* is the colour of the flower, which is here dull purple, and by no means equal to what I have seen in Mr. Ewbank's garden in the Isle of Wight. But it does not generally flower freely here, one flower to ten barren shoots being about the average. *C. Wolley Dod, Edge Hall, Malpas.*

FRUIT REGISTER.

GRAPE GROS MAROC.

We have here growing, in one of the vineries, a Vine of this noble-looking Grape. It is worked on the Black Hamburgh, and makes strong growth, and produces an abundant crop of not large, but very compact bunches, and especially on the young rods. The berries generally grow to a capital size, and finish well. But, after having said this, there is nothing more to be urged in its favour. From some cause unknown to me, I have never been able to cut from this Vine a single bunch with good flavour, and it is one of the worst in that respect that is grown here. The bunches hang for a time fairly well, then the skin becomes tough as leather. Is this the character generally of this variety? If so, intending planters should think twice before getting it. It may very probably be valuable as a market variety, being something that will catch the eye of the buyer. *H. Markham, Mereworth Castle.*

APPLE FOR COLD SOILS AND EXPOSED SITUATIONS.

I have under cultivation about sixty varieties of Apples, and on going over the orchards I have been struck by the vigour and fruitfulness of the Scotch Bridget. This Apple is well known in Lancashire, especially near Preston, but is not found in the catalogue of any Midland or Southern nursery. For exposed situations it has no equal in hardiness; its growth is rapid, and it bears after the third year. The fruit is of a fair size, Codlin-shaped, and of excellent quality for culinary purposes. It is fit for use at the beginning of October, and will keep much better than Warner's King or Stirling Castle. The tree has one fault, and I suspect this is the reason that it is not a favourite in the nursery: the branches have a tendency to grow downwards, which, no doubt, gives trouble in training good-looking trees for sale purposes; but this faulty habit should not prevent its extensive cultivation in places it is well adapted for. *James Ellis, The Gynsills, Leicester.*

FORESTRY.

DAMAGE DONE BY CROSSBILLS.—In a recent contribution of mine to the pages of the *Gardeners' Chronicle*, regarding the injury done to Spruce Fir trees here, I attributed the destruction to these birds picking out the buds of the young shoots, although then not actually having seen them engaged in it. My views have since, however, been fully confirmed by these birds—crossbills—having been seen busy at their depredations on Spruce Firs, and strewing the ground with young shoots under them, which seems to me conclusive evidence that these are the birds which have done so much damage to Conifers at this place during the past spring.

Judging also of the time when the forests here were so much overrun by squirrels, and when they were destroying *Pinus sylvestris* by thousands in young plantations of trees from 20 to 30 inches high, none of the Spruce Firs were seen to be touched, does not the same idea strike those who adhere to the belief that the squirrel is the sole depredator when they are plentiful and always around them, that they have not been seen at similar work in former years, and making use of these buds as their natural food? I admired the playful nimble action of these little quadrupeds as much as any one, until their destructive habits became unbearable in forests and gardens. In the latter department they made

free in carrying off and destroying a considerable quantity of both Apricots and Plums, and this havoc was a reason their death warrant was proclaimed.

While on the subject of crossbills I may mention that on looking over Elgin Museum along with a friend on Saturday last I observed a nest of a crossbill which the keeper informed me was recently brought in by a school-boy from the woods at Gordon Castle. Inside of the nest was a fine specimen of a male bird, and an egg of the same species by the side of it. The nest was made up of small Larch twigs at the bottom, and the sides were well lined with fine dry grass. *J. Webster, Gordon Castle Gardens.*

PLANTS AND THEIR CULTURE.

HARDENBERGIAS AND KENNEDYAS.—The majority of these plants will now have done flowering, and attention should be given to thinning, training, and regulating the young growths, cutting out all weak and superfluous shoots, so that every part of the plant may receive a fair share of light and air, as it is only when these plants are afforded a maximum of these that the best results are attained. They are not well adapted for pot culture, but few other plants are more effective when in flower when planted out and trained up a rafter, pillar, or light end of a greenhouse. The soil best suited for them is a light loam, but if the loam be heavy the addition of leaf-mould or peat and sand will be beneficial. Old-established plants had better have the surface-soil removed, the remainder carefully pricked up with a fork, and have a sprinkling of some mild manure applied, finishing with a top-dressing of the compost recommended. They are all easily propagated. Cuttings of the half-ripened wood, if inserted round the edges of small pots, filled with sandy compost, and stood in an ordinary frame or in the greenhouse, under a handlight, carefully shaded and watered, will be nicely rooted in a few weeks, when they should be potted off; but as most of the species produce seeds plentifully, this offers the best mode of increase; moreover, the plants raised from seeds usually grow freer than those raised from cuttings.

Of *Kennedya*, *K. prostrata* and its beautiful variety, *Marryatta*, are two of the best, both being bright scarlet, with a yellowish-white blotch at the base of the petals; *K. rubicunda* is a strong growing species, with dull red, dark-coloured flowers; *K. australis* or *coccinea* is similar to the last, but has much brighter coloured flowers; *K. nigricans* has deep violet or purplish-black flowers, and is very distinct.

Of *Hardenbergias*, *H. monophylla* is perhaps the best known; it has a much closer and compacter habit than the *Kennedyas*. The same may be said of *Hardenbergia ovata* and its variety, *O. alba*. These two sorts are quite distinct from *monophylla*, the leaves being broadly ovate, acuminate, and the flowers in larger racemes than *monophylla*, and which has more or less cordate oblong lanceolate leaves. There is a distinct dwarf growing species called *H. lilacina*, with lilac flowers; *H. Comptoniana* is the strongest grower of the group. Cool greenhouse temperature suits all the species.

Bouvardias.—Plants intended for winter flowering should now be encouraged to make all the growth possible, consistently with due regard to the future ripening of the wood. During the summer months *Bouvardias* are better grown without fire heat in cool pits or frames fully exposed to the light. The pits should be shut up early in the afternoons, at the same time syringing the plants, and allowing the temperature to rise considerably. It is, however, advisable to put on a small chink of air at the highest part of the structure early in the evening. A variety of composts suit the plants, but when it is remembered that they are fine-rooted hard-wooded plants the cue is given to the kind of soil required—that is, one composed of one half loam, the other half leaf-mould, thoroughly decayed manure, peat and sand, varying in quantity according to the quality of the loam; and above all things make the soil rich. Different growers fancy different varieties. I like *Vreelandi*, *Alfred Neuner*, *President Garfield*, and *elegans*.

Chrysanthemums.—These should not be allowed to become much pot-bound before being put into their flowering pots. In potting up the collection it may happen that some sorts, through being late struck, or other causes are not ready to be potted, it will, therefore, be best to put all such to one side

for the present, as nothing is gained by moving them until they really require it. A rather strong and rich loam is the best kind of soil to use, but success may be attained by using almost any kind of soil, and if it is of too light a description ram it very firmly into the pots, using plenty of sifted decayed manure and bone-dust; if it be heavy add sand and brick rubbish and not ram it quite so firmly. In all cases provide good drainage, and do not use pots of too large a size—for single plants 9-inch pots will be sufficiently large, it being better to give liquid manure, when the pots become full of roots, than to overpot them. If two or three plants are to be grown in one pot then possibly 11-inch pots would not be too large. After potting a sheltered position where the plants can be well exposed to the sun with the pots plunged in coal ashes, sawdust, or similar materials suits them well. In such a position they are not liable to become drawn, and with due attention to watering the wood gets so thoroughly ripened that good flowers generally follow. On warm evenings the plants are much benefited by being well syringed or engined. In arranging the plants in their summer quarters care should be taken that every plant gets a full share of light and air and avoid crowding.

Pelargoniums which are going out of flower, if they are to be kept for another year, require to be further attended to for a few weeks by being watered, and if they have become weakened by being placed in unsuitable positions when in flower they will be benefited by being shaded from the sun's rays for a few days, but immediately they are sufficiently recovered they should be placed out of doors and fully exposed, the object being to well ripen the base of the shoots before cutting them back. Plants thus treated break away with nice sturdy shoots. If there is any deficiency in the spring-struck stock put in more cuttings, choosing shoots from the flowered plants and which have not flowered, or at all events have not been much exhausted by flowering. Pinch and pot them on as they require it, and the young plants previously struck should be placed in cool frames and kept free from green-fly. Remove the sashes from them in fine weather. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

BEDDING PLANTS.—Any planting that yet remains to be done should be pushed forward and brought to a close quickly, even though it be at the expense of some less important work in other departments. Sub-tropical plants which have been gradually hardened off should be planted out forthwith, loosening the roots lightly with a pointed stick where they have become matted together—*i.e.*, of soft-wooded species raised from seed the current season—not forgetting also in case of partial dryness at the roots to give them a thorough watering beforehand, and stake and tie all tall growers as the work of planting proceeds. Where bedding-out was finished in good time certain plants will require attention in regard to pegging down; of such are *Verbenas*, *Heliotrope*, and *Petunias*; and if a display of bloom is not demanded for another week or two, it will be advantageous to pinch off all flowers that are open at the present time, and also to pinch out the points of the strongest shoots; by so doing the plants will gain vigour, cover the surface more quickly, and afford a better show of bloom at a later period. Early planted *Cerastium* and *Sedums* should also be looked over, and have all flowers cut off and the growth trimmed and regulated as often as occasion demands—*i.e.*, in carpet beds. In the event of dry weather, attend assiduously to the watering of late planted stuff, which is best done in the evening.

Wallflowers.—Young plants raised from seed sown last month should now be put into their summer quarters, giving them a distance of 6 inches in the rows and 9 inches between the rows, preference being given to an open position, when it is a matter of choice. We prefer to grow these plants in poor soil, and never dig in any manure for them, and the result is sturdy, thrifty plants for transplanting in October in their flowering quarters, and which are well able to withstand the rigours of a severe winter. Do not allow the young plants to suffer from want of water, and through the ensuing months keep the surface-soil between the rows well stirred with the Dutch hoe. Cuttings may now be put in of the old double yellow and dark red varieties. Cuttings taken off with a heel, and inserted in a sandy com-

post in a shady situation, will root in due time. Prick out also young seedlings of *Sweet Williams*, and treat them in the same manner as *Wallflowers*.

Chrysanthemums.—Old plants that were planted out in March, and are intended to flower outside, and such as were repotted and plunged in open borders, as advised in the *Calendar* for March 10, should now be looked over, all weak and spindly shoots being removed, leaving about eight or nine of the strongest only. The staking and tying of the most forward and vigorous plants ought not to be further delayed. Examine the points of young shoots for aphid, and where such are found dust them over with tobacco-powder, the plants to be syringed overhead immediately beforehand if dry at the time. Do not stop the shoots, but allow them to grow unchecked.

Box Edging.—This may now be clipped, and put into order, sheep-shears being found the best things to be used for the purpose. Although, in itself a simple operation, it may easily be spoiled if left to unpractised hands, and when the men happen to be new to the work, it is as well to give them a "lead," at the same time impressing upon them the importance of not cutting into the old wood, which would cause a stubby and unsightly appearance for the remainder of the summer. *J. Horsefield, Heytesbury.*

THE HARDY FRUIT GARDEN.

STRAWBERRIES.—The plants of early varieties on warm borders, are swelling off their fruits rapidly, and should the weather continue very dry a thorough soaking of pure water may be given, but apply no manure-water whilst fruits hang on the plants—it is a nasty practice. After watering, the framework on which the nets will be suspended should be erected. Nets merely spread over the surface of the beds, will in some gardens suffice to prevent the fruit being eaten by birds, but in wooded parts something more is generally wanted, or the blackbirds and the thrushes will pick the best berries. By using a framework for the net to rest on, the latter can always be easily removed when fruit is gathered. The late varieties are now pushing up their flowers, and must receive water in abundance if the soil be dry. It is a good plan to make notes now of the number of plants which will be required for forming new beds in the autumn, so that when layering time comes the required number of plants may be layered, and if pots are used, these may be prepared by being filled with soil on rainy days, remembering that the soil can hardly be made too rich for them. If the plants are required to fruit next year, they should be layered as early as good layers can be got.

General Directions.—Look over *Raspberries* which will fruit in the autumn, tying up the young canes to the wires, or whatever else may be used to train them on. *Gooseberries* where preserved in a green state are now ready for gathering. These berries should not be allowed to get large, the skins then becoming tough in boiling. The *Rough Red* and the *Warrington* are varieties large enough at this time of the year for bottling purposes, and should be gathered, as also all others, in a perfectly dry condition. *May Duke Cherries* had better receive a final cleansing before being netted over, the birds attacking the fruit as soon as they show the least tinge of colour. The nets must be securely fastened to the wall, or pegged to the ground as the case may be, for should but a small aperture be left open sufficiently large, the birds will not fail to make use of it. The same remarks apply to the *Keatish Cherries*, which are generally preserved whole, and therefore need to be well protected. For protecting *Cherries* of all kinds I find that half-inch tanned netting is the most efficient and durable for the purpose. *A. Ward, Stoke Edith Gardens, Hereford.*

FRUITS UNDER GLASS.

PEACHES.—Trees from which the fruit is all gathered should be frequently syringed to keep the foliage clean, this being a matter of the first importance, as on the proper ripening of the wood and the plumping of the flower-buds, the next season's crop will depend. If the trees have been in bearing some time, an occasional application of weak manure-water will be found of benefit; and do not allow the trees to feel the least dryness at the root from now

onwards till the leaves drop naturally, else bud dropping in spring will result. Throw the house open night and day, and if the roof be portable let it be removed, and fully expose the trees, not omitting attention to cleansing and watering.

Houses in which the fruit is ripe should be kept with full air on night and day, this being the means of securing high flavour. It used to be the custom to hang nets under the trees and allow the fruit to drop; but it is much better to go over the trees daily when the fruit is cool and gather all that are ready. A little practice will soon enable any one to discern when a fruit is fit to gather; there must be no pressure of any sort. As the fruit is gathered, it should be placed in an airy room on a soft surface, each day's picking being kept separate. When there is likely to be any irregularity in the supply, the next house may now be hurried forward, or retarded as the case may be. The night temperature may be advanced to 70° and this can now be easily done without the aid of much artificial heat; avoid, however, a moist and stagnant atmosphere.

Succession-houses.—Trees which are swelling a heavy crop of fruit should be assisted by some artificial manure or cowdung-water. Keep the foliage clean, and damp the paths and walls in the morning and at shutting-up time; pinch all gross shoots and lateral growths, keeping the shoots systematically tied to the trellis; and push the foliage to one side to allow the sun to give colour to the fruit, remembering that, as a rule, the higher the colour the better the flavour.

Late Houses.—Trees in these houses will now be forward enough to be finally thinned; reserve all the best placed fruits, and if all be right at the root there need be no apprehension of fruit dropping at a later date. Attend to the tying and training, allowing plenty of space between the shoots. Now is the best time to retard the crop if this should seem desirable, and to do so, freely open the ventilators. This is a more preferable method than having recourse to shading. Keep the syringe going vigorously, and water the borders outside, applying a mulch of horse-droppings or other suitable material afterwards. *W. M. Baillie, Luton Ho.*

THE KITCHEN GARDEN.

MULCHING AND WATERING.—These operations tax the energy and the resources of the kitchen gardener severely during a period of warm dry weather, especially if the soil be shallow and dry; still if a succession of vegetables of good quality must be maintained, it is necessary that water should be afforded the crops abundantly, and this is very important, if specimens are required for exhibition, and to such may be reserved for this purpose liquid manure should be given occasionally. On dry soils much good may be done by applying a thick mulching of manure after heavy rain has fallen, and before the surface of the ground has got dry; and in default of manure or straw from the stable, short grass makes a fairly good mulch. The soil should be kept well loosened among growing crops where mulching cannot conveniently be done, thereby rendering the evaporation from the soil much less than it otherwise would be. Enough water should always be given at one time to thoroughly soak the soil, and where *Celery* in trenches is watered a little soil should be scattered along the trenches immediately after each application, thus preventing the evaporation of water from the soil by the soil acting as a mulch. *Celery* will also be improved by doses of liquid manure occasionally, also *French Beans*, *Scarlet Runner Beans*, *Peas*, *Cauliflowers*, *Lettuces*, *Onions*, and *Asparagus*. The stems of the last named, if large heads are looked for next year, should be secured from wind waving if in exposed situations, and a little common salt be sprinkled over the beds at the rate of about 1 oz. to the square yard. A dressing of soot should be afforded if the Onion is likely to be troublesome, and if autumn sown Onions are attacked by mildew at the roots it may often be prevented from spreading much by a timely application of guano, soot, and lime mixed together in equal quantities by measure, and applied at the rate of 1 pint to a square yard of surface, just before a shower of rain.

Seeds.—Sow some more of *Snowball* and *Red Globe Turnips*, *Lettuces* in variety, *Spinach*, *Scarlet Runner Beans*, and *French Beans*, *Radishes* on cool borders, a little *Cobwort*, and some very late *Broccoli*. *W. H. Davies, Kilton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, JUNE 21—Linnean Society.

SHOW.

WEDNESDAY, JUNE 20—Royal Botanic Society.

SALES.

TUESDAY, JUNE 19 } Imported Orchids, at Protheroe & Morris' Rooms.
 WEDNESDAY, JUNE 20 } Imported Orchids from Messrs. H. Low & Co., and Orchids in Flower, at Stevens' Rooms.
 THURSDAY, JUNE 21 } Established Orchids from Mr. F. Sander, at Stevens' Rooms.
 FRIDAY, JUNE 22 } Imported Orchids, at Protheroe & Morris' Rooms.

It is said with some truth that we have too many varieties of almost everything, whilst the number is constantly being added to. We have certainly too many varieties of Apple, the same may be said as regards the Pear, and, indeed, most other fruits. A similar objection applies to culinary vegetables and to flowers. This being so some cultivators come to the conclusion that it is always advisable to stick to the old and well-tried sorts. This it is, no doubt, desirable to do until something better is found to supersede them, but, before this can be ascertained, a trial must necessarily be made. Evidently the better course to pursue is to give eligible novelties a fair trial, upon a limited scale in the first instance, and thus to gain an idea of their merits or demerits. But to abstain from growing novelties until their merits are, as it were, forced upon observation by other and more enterprising cultivators is hardly the way to encourage progress or reap its advantages. It will, of course, be admitted that the growing of novelties not unfrequently results in disappointment, but at the same time much interest is experienced in watching the experiments, and which may to some extent compensate for occasional disappointment.

It is said that the originators of novelties should prove their merits or demerits before introducing them to the public. No doubt this is generally done, but at the same time, some allowance must be made on the score of the natural partiality experienced in favour of one's own productions. A like allowance should be made on account of the differences consequent upon diversities of soil and situation. It is not infrequently found that novelties do not main-

tain the high character that was justly assigned to them in the first instance, after they have been removed from the soil and situation in which they originated. Those, however, who are old enough to remember the varieties of fruits, vegetables, and flowers, which were cultivated and held in esteem some thirty or forty years ago, must admit that a vast improvement has somehow been effected since the time alluded to, and it seems almost ungrateful now to throw cold water upon the efforts of those who by industry and perseverance are still endeavouring to effect improvements.

Even as regards the Apple, with its admitted superfluity of varieties, it must be acknowledged that such varieties as Cox's Orange, Lord Suffield, and various other productions of comparatively recent years—are improvements upon many of those which preceded them. The same may be said with regard to the Pear, and other varieties of hardy fruits.

Even in the case of the Strawberry it must be acknowledged that such comparatively recently introduced varieties as Sir Joseph Paxton, Sir Charles Napier, and Loxford Hall Seedling, &c., are improvements upon the good old Keen's Seedling, which may have been regarded as a dubious novelty about the period referred to. In the same way the Grape Vine has of late years had valuable additions made to its varieties. In the matter of culinary vegetables this advance has been quite as marked as in the case of fruits, as witness the great improvement in the varieties of the garden Pea, the Cauliflower, and other members of the genus Brassica.

Among the various groups of decorative plants the improvement has of late years been, if possible, even more conspicuous and decided; as is illustrated by the Rose, and numerous other genera of flowering plants, such as the Fuchsia, the Pelargonium, the Dahlia, the Petunia, the tuberous Begonia, &c. The Fuchsia, appears to have been introduced to this country from Chili about a century ago. But the improvement which has been effected in the plant since its first introduction, or, say, within the last forty years, is very remarkable. The same may be said with regard to the Pelargonium, more particularly the zonal section of that extensive genus of flowering plants, and which is now found to be so useful for winter as well as summer decoration, producing in abundance flowers of the finest form, double as well as single, and of nearly all shades of colour. These useful decorative plants are, with good reason, supposed to have been derived from the blending of two species, viz., *P. zonale* and *P. inquinans*, which were introduced in the early part of the last century, although few, if any, successful attempts were made to improve them until about the period mentioned. The Dahlia was introduced from Mexico about a hundred years ago; it appears to have been then, as well as for many years after its introduction, a coarse-growing plant, producing single flowers of little merit: some of the varieties, however, appear to have shown slight tendency to doubling, of which circumstance the cross-breeder took advantage, with the result which is annually to be seen. The Petunia was introduced from South America about 1823; subsequent introductions were also made, but the chief improvement in its flowers, which are now double as well as single, have been accomplished by the efforts of the cross-breeder. The numerous and very beautiful varieties of tuberous-rooted Begonias may be regarded as among the latest triumphs of the hybridiser's industry and skill. The

first tuberous Begonia appears to have been introduced to this country about the year 1810, and was a plant of but little merit from a decorative point of view: while the hybrid varieties, which have of late years been obtained by the crossing of this with more hardy and larger-flowered species, constitute a race of plants of marvellous beauty, with double as well as single flowers of immense size, fine form and beautiful shades of colour, admirably adapted for the decoration of the greenhouse and conservatory throughout the spring, summer, and autumn months, while the hardier sorts are well suited for outdoor culture, or the bedding out in the flower garden.

This improvement is still progressing, and with the energetic perseverance of such cross-breeders as Messrs. LAING and Messrs. CANNELL, it is hard to say when or where it may stop; so that, taking into consideration what the cross-breeder has done, and is still doing, for the cause of horticulture, it may be regarded as unwise to discourage in any degree his efforts, as it is to persist in the cultivation of inferior varieties of fruit, vegetables, and flowers, which require in all respects as much care and attention as the superior varieties.

THE ROYAL HORTICULTURAL SOCIETY.—At the Council meeting, held on June 12, a sub-committee was appointed to consider the question of the arrangements for 1889, and more especially to consider certain proposals made by Mr. VEITCH, such as the appointment of a Botanical Lecturer, to deliver short popular addresses to the Fellows, and other matters of importance and interest. The question of the early revision of the bye-laws was taken into consideration, and a letter from the solicitors was read promising the revised copies at an early date. The suggestions of the Fellows' Committee as to the appointment of local secretaries were adopted.

INSTITUTE OF FRANCE.—It appears that Dr. MASTERS, whose election as correspondent in the Botanical section in the room of the late Dr. ASA GRAY was announced last week, was elected by thirty-nine votes out of forty-six. Such a distinction is indirectly a high compliment to the Horticultural Press of this country.

MANCHESTER ROSE SHOW.—Owing to the general forwardness of the bloom this season, it has been found advisable to alter the date of the above important show from July 21 to July 14.

THE LINNEAN SOCIETY: June 7.—The President (Mr. CARRUTHERS) in the chair. Messrs. G. C. HAITE and C. A. HEBBERT were elected Fellows of the Society. The following were nominated Vice-Presidents:—Mr. F. CRISP, Dr. MAXWELL T. MASTERS, Dr. JOHN ANDERSON, Mr. C. B. CLARKE. An exhibition under the microscope of decalcified and stained portions of the test of Laganum depressum was then given by Professor MARTIN DUNCAN, who made some very instructive remarks on the structural characters to be relied on for discriminating the species. Mr. D. MORRIS, of Kew, exhibited some drawings of a fungus (*Exobasidium*) causing a singular distortion of the leaves of *Lyonia* from Jamaica. A paper was then read by Mr. H. N. RIDLEY on the "Natural History of Fernando Noronha," in which he gave the general results of his investigations into the geology, botany, and zoology of this hitherto little explored island.

OXFORD CHAIR OF BOTANY.—The electors to the Sherardian Professorship of Botany have elected Dr. S. H. VINES, M.A., F.R.S., F.L.S., Fellow of Caius College, Cambridge, to this Professorship, in place of Dr. BALFOUR, who has proceeded to Edinburgh.

FRUIT PACKING.—The committee of the Society for Promoting the Employment of Women has resolved to try to carry out a scheme which has been suggested to them. This scheme, should it prove feasible, will be the means of enabling respectable

In England, the method is to pack loose in bushel or half-bushel baskets, while the Continental plan is to pack in small baskets or boxes that meet the requirements of the ordinary customer. Our fruit is unsorted, and varies in size and condition, and much

London, W. It is well that attention should thus be drawn to the imperfect way in which much of the fruit sent to market is packed. Many complaints as to the low prices realised in the market are explained by the careless way in which fruit is too often packed.

FIG. 100.—YUCCA FILIFERA, NATIVE OF NORTH-EASTERN MEXICO, BETWEEN RIO GRANDE AND MEXICO. (SEP P. 743.)

working-women from town to get change of air and occupation for two or three weeks during the months of June, July, and August, earning at the same time fair wages. Upwards of 2½ millions are spent annually in England on imported fruit, while much of our home-grown produce is wasted. This is in a great measure attributable to the difference between the English and the Continental mode of packing.

gets damaged and wasted, while the Continental is carefully sorted. This sorting and packing would be a new English industry, so, too, would the evaporation of fruit. The present scheme is, that this work shall be done by neat-handed women from the large towns, who would thus get change, while they would earn about 12s. a week. For further particulars, apply to the Secretary, 22, Berners Street,

THE GARDENERS' ORPHAN FUND.—It is satisfactory to learn that after the payment of all expenses of the recent Market Fête a substantial balance remains to the credit of the Fund. That it was not larger is, however, hardly to the credit of some of the thousands of visitors who attended this unique entertainment. Many of those present had probably no convenient opportunity for bestowing

their mites, and may be glad to know that the Treasurer is T. B. HAYWOOD, Esq., Woodhatch, Reigate, to whom we shall be glad to transmit any sums that may be sent to us. Indirectly, great benefit is likely to arise from this novel *fête*, the idea of which originated with Mr. HOWARD, of Southgate. The market officials, the growers, and the committee are all entitled to praise for their endeavours. A scrap of information that we omitted to give last week may be supplied now—the bouquet carried by Lady GOLDSMID, the wife of the President, Sir JULIAN GOLDSMID, M.P., was presented by Miss BARRON, the daughter of the highly respected Secretary to the Fund.

ROSE SHOW AT TORQUAY.—Last year a fund was started by Messrs. CURTIS, SANDFORD & Co., nurserymen, Torquay, and under distinguished patronage, for the benevolent purpose of enabling invalid gardeners from the North to come to Torquay for a short rest and change. As a pleasant means of adding to the fund a Rose show was held in Messrs. CURTIS' nursery, at which valuable money and other prizes were awarded to the best exhibitors. This year the experiment will be repeated, with a Silver Cup as the highest award, and money prizes ranging from a guinea downwards.

NEW WARM-HOUSE RHODODENDRONS.—A few seedlings of these fine plants were observed in flower recently at Messrs. J. VERRILL & SON'S nursery, Chelsea. The end aimed at by the hybridiser has been the production of large fine foliage—something like that of *R. javanicum*, as well as good heads of flowers. In some instances success in this direction has been attained, and in most the colours are good, attended in a few by a shortening of the tube, which gives more compactness to the corymb. In No. 31, a result of crossing *R. Teysmanni* and *R. multicolor*, the colour is buff and pink, the tube short, and the foliage on young plants an inch wide: No. 32 is rosy-crimson, and was obtained by crossing the hybrid *R. Princess Royal* with *R. multicolor*, the latter being the pollen bearer; No. 35 has scarlet flowers, and was obtained by *R. jasminiflorum* × *R. Curtisii*; No. 348 is orange-scarlet, from *R. javanicum* × *R. multicolor*. It has the foliage of *javanicum*. No. 55 has fine large foliage and good habit, with yellow flowers of a nice tint. *R. Princess Royal* × *R. Teysmanni*.

A GARDEN FOR POPLAR.—Heavy rain, observes the *Echo*, somewhat marred the effect of, and lessened the attendance at, the opening ceremony on Friday, June 8, of the garden which has been laid out by the Metropolitan Boulevard Association on the site of the disused burial-ground of Trinity Chapel, India Dock Road, Poplar. Mrs. Buxton declared the gardens to be open to the public. Votes of thanks and the singing of "God save the Queen" brought the brief formalities to a close, and the party invited walked round to see the improvements effected by the Society, at a cost of £300. The chapel itself was built by some of the ancestors of the great shipping family of GREEN, several of whom lie buried there. All the monuments have been reverentially treated, while fresh green turf has been laid, and beautiful flowers planted. Seats are provided, and the garden bids fair to be a boon to the neighbourhood, as there is no other open space available to the aged as a quiet retreat, or the children as a playground, nearer than the recreation ground at Stepney. When the gates were thrown open it was a pleasing sight to see the stream of people, of all ages, who quietly passed in to see the pretty spot that has been laid out in their interests. It covers nearly an acre of ground, but Mr. CHADWICK, in a speech pointed out one or two ways in which it might be enlarged and a gymnasium provided.

A RARE FLOWER.—The Vienna correspondent of the *Standard*, telegraphing June 3, says:—"Tomorrow there will be witnessed in the Palm-house at the imperial palace of Schönbrunn a spectacle which

has hitherto been seen only once before in Europe—to wit, the Palm tree, *Brownea ariza*, in full bloom. This tree, which is named after the celebrated English botanist, arrived at Schönbrunn forty years ago from London. It was then an insignificant sprig, but now it vies in magnitude with the *Maria Theresa Palm*, which is 170 years old, and in the same Palm house. It blossoms only once in fifty years, and the bloom lasts only forty-eight hours. The last time the blossom of the *Brownea ariza* was seen was, I believe, in June, 1851, in the Duke of NORFOLK'S conservatory at Chiswick." If the political and other information which special correspondents forward to daily papers is as accurate as the above how delightful their notes must appear to those who really know. No doubt our gardening [] friend in Vienna was in sore need of something worth noting, and he has fallen into the hands of some merciless wag of a gardener. *Brownea ariza* is not a Palm, but a member of the Bean and Pea family. It flowers at Kew annually, the last time about two months ago. It was discovered in New Grenada by Hartweg in 1842, but was not known in cultivation till about thirty years afterwards. It was first flowered in Belgium by M. LINDEN, and in the United Kingdom by the late Dr. MOORE, of Glasnevin. From the latter plant a plate was made and published in the *Botanical Magazine* in 1880. It is not nearly so grand as *B. grandiceps*, which flowered for the first time at Kew in 1855, and probably every year since then. All the *Brownes* flower regularly every year, and their blooms last about a week. In the *Gardeners' Chronicle* (at p. 70, 1851) it is stated that *Brownea coccinea* flowered at Kew, and the correspondent probably confounded the Royal Gardens, Kew, with the gardens of the Duke of Norfolk at Chiswick, and the species *ariza* with *coccinea*.

MR. BULL'S EXHIBITION.—Her Majesty the Queen of SWEDEN and Norway paid a visit on the morning of Tuesday, June 12, to Mr. WILLIAM BULL'S Orchid exhibition, Chelsea. Her Majesty, on leaving, accepted a *recherché* bouquet of Orchids.

GLOXINIAS AT HOOPER & CO.'S.—In Messrs. HOOPER & Co.'s Maida Vale branch establishment their strain of Gloxinias is now in full bloom. A fine bank of them set up with Maidenhair Fern and *Asparagus plumosus* show them off to great advantage. The flowers are large, the colours very clear and distinct, and many of the spotted and mottled kinds are of exquisite beauty. The large conservatory, in the trade, shows many tasteful arrangements of flowers among the fine Palms and tree Ferns. The rockery is also beautiful. The house of *Caladiums*, the houses of Palms and decorative plants, the houses of double *Primulas*, and, indeed, the many improvements in the whole establishment, do great credit to Mr. BAVERHUIS, the manager.

MR. ROGERS.—We have already announced the retirement of this gentleman from his post as Superintendent of the park at Battersea, where his taste and knowledge of plants suitable for various kinds of garden decoration, have long since gained for him the approbation of his peers. Mr. ROGERS is in ill-health and it has been felt that a practical mark of sympathy would be opportune at this time. Mr. HARRY VERRILL, Royal Exotic Nursery, Chelsea, has consented to act as Treasurer to any fund that may be raised for this purpose.

ORCHIDS AT THE IRISH EXHIBITION.—Last Wednesday and Thursday, visitors to the Olympia at Kensington had the pleasure of seeing a table of Orchids in the centre of the building. The plants were those of J. T. PEACOCK, Esq., Sudbury House, Hammersmith. *Miltonia vexillaria* formed the major part of the display, there being over seventy plants, some with very pretty colouring. *Dendrochilon longifolium* was well represented by one piece. Of *Cattleya Mendelii* there were several varieties of fine colours. *Epidendrum*

vitellinum made a brilliant show, and among other plants were *Odontoglossum citrosum* and *O. c. roseum*, *O. cordatum*, *O. c. aureum*, a very pretty thing; *Cypripedium Stonei*, *Masdevallia Harryana*, *Oncidium crispum*, &c.

THE LOQUAT.—A branch of this Chinese plant, bearing a score of thoroughly ripened fruits, was kindly sent for our inspection by Mr. G. DONALDSON, gardener, Humewood Castle, Co. Wicklow. The plant from which this was cut has borne this season about 800 fruits, and is growing in the open air. Ripe fruits are very nice eating, and would, were the cultivation of the fruit carried out in an organised manner in mild districts in Ireland, and elsewhere at home, prove a marketable commodity very remunerative to the growers.

UMBELLIFERÆ IN AFGHANISTAN.—Dr. AITCHISON (*Transactions of the Linnean Society*) notes that these are "characteristic of this flora, and many of them are of large dimensions, including *Ferula foetida* (*Asafœtida*), [of which a specimen was exhibited at a recent meeting of the Royal Horticultural Society, from the Royal Gardens at Kew], *Ferula galbaniflora* (*Galbanum*), and *Dorema ammoniacum* (*Gum ammoniacum*). In four months these large plants have come and gone, suddenly appearing in the beginning of May, when their root-foilage is fully developed, covering the whole country with a carpet of the richest verdure; they as completely by the end of August have disappeared. If there is anything at all to be seen of them subsequent to this period it consists merely of a few dried stems, with an occasional bunch of ripe fruit. Usually these three plants grow gregariously and unmixed; sometimes, however, the *Asafœtida* and the *Ammoniacum* are associated together. Of the *Asafœtida* only one plant out of a hundred met with was in flower, and in that state it is remarkable for the Cabbage-like head at first thrown up, the flowers being enclosed in the enormous sheathing stipules, of which the stem-leaves almost entirely consist. As development progresses these are thrown off, and for a short time the flower-head presents the appearance of a large Cauliflower. From this period the stem bearing the inflorescence rapidly shoots upwards to a height of from 4 to 5 feet, its proportions being singularly massive and pillar-like. The *Ammoniacum* and *Galbanum* seem to me to differ from the *Asafœtida* in throwing up from their perennial roots a flowering-stem annually, whereas the *Asafœtida*, after several years' growth, throws up a flowering-stem, and then dies. This view may appear unsound, but the facts that all the plants of the *Ammoniacum* and *Galbanum* were seen to be either in flower or in fruit, and that their stems and roots were found to vary greatly as to size, go a long way to support my opinion; but this remains a subject for future investigation. The *Galbanum*, from its youngest stage, has a slight tinge of yellow all through its stems and leaves, and there is a general semi-transparency about the plant which gives it the appearance of being made of wax. When a great bed of this is in full but young blossom, the sight is a most striking one, the whole plant, at that period of its growth being of an orange colour. The *Ammoniacum* is more remarkable for the great expanse of its root-leaves, and the similarity which they present to the same leaves of the *Asafœtida*—so great, that experts alone could possibly distinguish them. The stems of all these large Umbelliferae vary from 4 to 5 feet in height, and probably that of the *Asafœtida* is the tallest, and is remarkable for its Bamboo-like appearance and its ending in a cluster of flowering peduncles; and that of the *Ammoniacum* for its enlarged nodes at the base of each stem-leaf. The stem of the *Galbanum* has no enlarged nodes, and its flowering peduncles originate irregularly along the stem, and are not clustered at the top of the stem. These Umbelliferae extend both into the Badghis and Khorasan. In the Badghis the greater moisture of the climate, I think, enables the *Galbanum* to attain its greatest perfection; but whenever they appear they excite

attention by their remarkable habit and magnificent appearance."

EXPERIMENTS IN CURING CANKER IN TREES.—M. PRILLIEUX, writing in the *Revue Horticole* for June, recommends the use of sulphate of iron as a means of ridding trees of canker. The substance has been found very efficacious against some other forms of micro-fungi, and it is thought that it will prove equally so when employed against *Nectria ditissima*, the fungus which is the cause of some forms of canker. The cancerous parts should be cut away, and the wood and bark washed with a strong solution of the sulphate.

PUBLICATIONS RECEIVED.—*Choice British Ferns*. By C. T. DREERY, F.L.S. (London: L. UPCOTT GILL, 170, Strand, W.C.)—*Report of the Minister of Agriculture for the Dominion of Canada*. (Ottawa: MACLEAN, ROGER & Co., Wellington Street.)—*Forest Flora of South Australia*, Part VIII. By J. E. BROWN. (Adelaide: E. SPILLA, Government Printer.)—*Note sur le Parc de la Liberté à Lisbonne*. Par C. JOLY. (Paris: GEO. CHAMEROT, 19, Rue des Saints-Pères.)

TREES AND SHRUBS.

GREVILLEA ROSMARINIFOLIA AND OTHER PLANTS AT COLWYN BAY.

The twig of *Grevillea rosmarinifolia* which I send is a fair specimen of the whole bush. It has stood the last three winters here without any protection, and is one of the neatest and prettiest shrubs I know. It has been in bud or flower for considerably more than two months; and as the buds are quite as bright in colour as the flowers, it has been very ornamental during the whole of that time, and is still in full flower. Belonging, as it does, to the singular Australian order of Proteaceae, it is as interesting as it is pretty. It has not been injured by frost in the smallest degree since it was planted out in 1885. Last summer I planted out two plants of *Elabrothamnus scaber* [?],—the scarlet, not the pink-flowered species—against a south-east wall, and was agreeably surprised to find them to-day alive and covered with flowers. *Olearia dentata* thrives well here on a warm bank; in a few days it will be a sheet of white flowers. *Colletia ferox*, *Caryopteris mastacanthus*, *Aristotelia racemosa*, *Pittosporum Mayii*, *P. engenoides* (this has had its shoots nipped), *Stephanandra flexuosa*, *Rhodotypos kerrioides*, *Baccharis patagonica*, have all stood the last three winters; also four or five species of *Eucalyptus* (I dare not venture to give them specific names), *Olearia Gunnii*, and *Schizopragma hydrangeoides*—the two last on a wall. *Chamerops excelsa*, or *Fortunei*, is throwing out three fine flower-spikes. *Alfred O. Walker, Nant-y-Glyn.*

NOTICES OF BOOKS.

A MANUAL OF ORCHIDACEOUS PLANTS. Dendrobium. Part III. James Veitch & Sons.

It will be remembered that this useful and exhaustive work on Orchids—designed principally for the assistance of the Orchard grower, amateur, and plantsman—contained in its first Part the genus *Odontoglossum*; and in its second, *Cattleya*, *Laelia*, and allied plants. We now have the pleasure to announce the third Part, which treats, in an equally admirable and lucid manner, of the *Dendrobium*. An enumeration of some of the best *Cirrhopetalums* and *Bulbophyllums* is likewise given. Following the plan of the previous issues, which have met with so much favour from those persons who are interested in Orchids, maps are given of the habitats of the species of *Dendrobium*, the names of the plants being printed over the regions they come from, thus conveying very interesting and valuable information, which, taken in conjunction with the elaborate opening article on the genus *Dendrobium* generally, and the climatic peculiarities of each and every locality from which the plants come, will afford good reasons to

many growers, both amateur and professional, why they have failed to grow certain plants satisfactorily, and point the way by which these mishaps may be avoided in the future. One of the maps gives the habitats of the *Dendrobiums* of India, Borneo, Java, and South Eastern Asia generally, and the other those of the Australian region, which, it is curious to note, follows in an almost uninterrupted belt the east coast line.

Lengthy paragraphs are devoted to the subjects of heating, ventilation, shading, watering, potting, &c., and in the descriptive enumeration of the species these subjects are again alluded to whenever any peculiarity of the species being dealt with requires it; and throughout the book the frequent allusion to the collectors, introducers of, and the first successful cultivators, call up pleasant reminiscences of the older enthusiasts and pioneers in the culture of these lovely plants. The *Dendrobium* number, which is profusely and well illustrated, extends over 104 pages; and as Messrs. James Veitch & Sons' *Manual of Orchidaceous Plants* is by this time so widely known over the whole world where Orchids are grown, it is unnecessary for us to say more than that Part III, "*Dendrobium*," is in every respect worthy of its predecessors.

SCOTLAND.

FLOWERING OF RHEUM NOBILE IN EDINBURGH.

This handsome species of *Rhubarb* is in flower for the second time in the Royal Botanic Garden, Edinburgh. The plant is the only one remaining out of a large number which were raised from Sikkim seeds presented by H. J. Elwes, Esq. in 1882. At present the inflorescence is about 2 feet high, forming a perfect cone like a sugar-loaf. The bracts, which overlap each other and protect the flowers, are very delicate and semi-transparent, and creamy-white in colour. The plant is at present growing in a sheltered part of the garden, surrounded by hedges, but it has only been in that position for about a year. It is hoped that the plant may ripen good seed, as seedlings raised from home-saved seeds may be expected to prove more amenable to cultivation in this country than those raised from Sikkim seeds. The plant which flowered in these gardens eight years ago (for the first time in Europe) was much taller than the present one, but scarcely so handsome. Unfortunately it met with an accident, and did not seed. Another plant, which flowered in the gardens at Drum Castle, Aberdeenshire, in 1883, is stated to have ripened good seed, but I have not heard what became of the seedlings, or if any are still alive. A few seeds of the Aberdeenshire plant which I received from Mrs. Forbes Irvine, in November, 1883, did not germinate. *R. Lindsay.*

THE NATIONAL SEED AND NURSERY TRADE ASSOCIATION.

The annual meeting of this Association, which was announced in our last issue, was convened by the Council of the Association by circular and advertisement, addressed to all concerned in the bearings of the "non-warranty clause," and all were welcomed, whether members of the Association or not. A large and representative gathering from all parts of the country met, and was presided over by Mr. James Watt, of Carlisle, the retiring President of the Association.

Mr. Watt, in opening the proceedings, pointed out the importance of the object of the meeting, and hoped that the subject of the "non-warranty clause" would be freely and fully discussed in all its bearings. Mr. F. B. Park, Haddington, moved, "That this meeting disapproves entirely of the 'non-warranty' clause now used in connection with the sale of seeds by many wholesale and retail firms, and do not intend to recognise the same in their business operations." He thought the attempt to introduce this clause should be discontinued; it was most discreditable

for any firm to take refuge behind it, and he trusted the meeting would heartily support the resolution. The buyer should get what he wishes to buy, and the seller should deliver what he agrees to sell; anything opposed to this was one-sided in its nature. Mr. R. B. Laird, Edinburgh, seconded the resolution, and characterised the non-warranty clause as most absurd. Mr. Tait, Manchester, in supporting the resolution, said it was a disgrace that the respectable portion of the trade should be subjected to this bane. Whatever might be the decision of the meeting, he should adhere to his former practice, and do business with no house exacting this clause. Mr. Davie, Haddington, demurred to Mr. Tait's remarks. He did not see there was any want of respectability of those firms who took precautions to protect themselves while they allowed the same liberty to those of whom they bought. While it was suicidal to sell seeds for what they were not, it was reasonable enough that they should protect themselves from accidents due to no fault of their own. Mr. Robson, Aberdeen, heartily sympathised with the object of the resolution. In reply to a query by the Chairman respecting the case in which Smith & Sons, Aberdeen, are involved, Mr. Robson said nothing further could be done till the opinion of eminent counsel to which it had been referred was given. Mr. Syme of the Lawson Seed Co., Edinburgh, said they had in the past experienced no difficulty in doing business without a non-warranty clause, and did not think his company would adopt it in any shape or form. Without assuming any particular virtue to any members of the trade it was not, he held, dignified in any firm to take shelter behind non-warranty, which really went in the face of the Mercantile Law Amendment Act. Mr. Drummond, Edinburgh, deprecated hasty adoption of the resolution before the meeting, which he considered would be binding on the trade. The subject of non-warranty had not, he thought, been sufficiently discussed. He understood the meeting had been called rather for conference and consideration of the question than for furthering any notion of that kind, which had apparently been brought to the meeting in the pocket of one of the gentlemen promoting it.

The Chairman explained that the resolution had been proposed by a member of the seed trade altogether independent of the London wholesale seed trade or any other body. Mr. Park had come forward in the interest of the trade generally, and it was hardly, therefore, fair to say that the Association had come there with cut-and-dry motions in order to bind the trade.

Mr. James Elder, Haddington, held that the resolution, if carried, would only fulfil the object for which they had met. The seed trade was, above all other trades, one of confidence, carried on by honourable men in the past; and it would, in his opinion, be a great pity if they should now attempt to shelter themselves behind this clause.

The Secretary of the Association, in reply to the Chairman, explained that in its present legal aspect the non-warranty clause was absolutely binding, and freed the seller from liability. Unless the House of Lords reversed the decision of the Court of Session, the clause would, so far as Scotland was concerned, continue to be binding.

There being no amendment proposed to the resolution, the Chairman asked those in favour of the latter to hold up their hands, which the great majority present did, and it was accordingly declared carried with practical unanimity.

Mr. Carter, Berwick-on-Tweed, suggested that a union should be formed among them for giving effect to the resolution, but the Chairman thought the object of the meeting had been carried out, and that sufficient had been done to call the attention of the trade to the matter.

A cordial vote of thanks was given to Mr. Watt for presiding, who then retired from the chair. The meeting then elected Mr. R. B. Laird to the chair, when it was agreed that copies of the resolution should be sent to all members of the trade, and

that a further meeting should be held, if thought desirable, on the first Wednesday in July.

The following gentlemen were elected a committee for the purpose of organising such meeting, viz.:—Mr. Carter, Berwick-on-Tweed; Mr. Elder, Haddington; Mr. Ireland, Edinburgh; Mr. Park, Haddington; Mr. Watt, Carlisle.

At the annual general meeting of the members of the Association, which took place at a later hour of the day in the same place, Mr. Watt presiding, Mr. R. Tait, Manchester; and Mr. A. Cross, Glasgow, were elected President and Vice-President respectively for the ensuing year. The committee reported that two essays had been sent in for the prizes offered by the Association on "The Causes of the Agricultural Depression." Neither essay was considered of sufficient merit to secure the prizes, but the committee recommended that an honorarium of £2 2s. be awarded to each, which was agreed to. Mr. Elder, Haddington, drew the attention of the Association to the practice in some quarters this season, owing to the high price of seed of foreign Italian Rye-grass, of supplying home-grown Italian Rye-grass under the former name, the latter being inferior in quality and lower in price. The committee noted the announcement with some surprise, and intimated that, should any case be brought before them, they would deal with it in a summary manner. The Railway Rates Bill, and the probable institution of a Department of Agriculture, were commented upon by the Chairman, and it was agreed that the next annual meeting should be held in Glasgow.

FLOWERS OF CONIFERS.

The blossom, both male and female, of coniferous trees has been unusually abundant this year, owing perhaps to the hot dry autumn of last year. It so happens that the descriptions and illustrations in the text-books are frequently defective as regards the male flowers. If the collector does not happen to be on the spot at the proper season, which is a short one, he has, of course, no means of obtaining the male catkins; the female cones, being of much longer duration, may be had, at some stage of growth, throughout the year. Herbarium specimens and botanical descriptions and drawings are consequently often incomplete for the reasons just given.

The male flowers are in some cases of great importance, not only in the discrimination of species, but even of genera. For instance, the curious tree which bears Fortune's name (*Abies Fortunei*) is proved by the male flowers—which are quite different from those of any *Abies* or *Picea*—to belong to the genus *Keteleeria*. This genus, like *Pseudolarix*, was hardly considered worth retaining, but the recent discovery of the male flowers settles the matter.

But as there are some who do not attach much importance to the completeness and accuracy of botanical drawings—are not careful to analyse the components of a beautiful picture, but rest satisfied with a superficial glance—it may be well to add that the flowers of the Conifers are in many cases of extraordinary brilliancy of colour. Thus, in the *Picea orientalis*, of which (thanks to Canon Ellacombe) we now give a figure (fig. 101), the colour both of the male and female plants is of the deepest carmine, thus adding materially to the beauty of a particularly elegant tree.

Abies amabilis (fig. 102) is not so frequently seen in English gardens, and we have ourselves never seen it produce male flowers.

Our specimen, for which we are indebted to Mr. Rashleigh, was of a greenish-yellow colour, but we are assured by Mr. Syme that he has seen the catkins of this species on more than one occasion, and that they are usually of a violet tint. In any case, the figures we now give serve to complete the illustrations already given in these columns of the trees in question—*Picea orientalis*, vol. xxv., 1886, fig. 62; *Abies amabilis*, vol. xiv., 1880, fig. 141.

HOME CORRESPONDENCE.

THE FRUIT PROSPECTS AND BIRDS.—Alas! how soon bright promises become blighted and falsified. This is so with the fruit crop in East Anglia, which only a very short time ago bade fair to be one of the best and most abundant we have had for years, but now proves to be just the reverse. Cold winds and frosts have had most disastrous effects, and maggots have made their appearance, doing great damage to Apples and Pears. This misfortune is of wide extent. I hear the cry from friends in various parts of the country, and from Kent comes the complaint that the maggot is committing so much havoc that growers are lamenting the destruction of sparrows, which they now—too late—appear to think would do so much good in the orchards. This, however, is not my experience of those birds, who much prefer corn and seeds to insects, but I should be glad to see more of the soft-billed birds which prey on garden pests, although, when dry weather

statement that few will agree with. Surely Mr. Jenkins would prefer potting them when they have made a few inches of growth than at the time the flower-buds are first visible. As a matter of fact we have potted Lilliums at various times, from early in January, before they had started into growth, until they had arrived at the stage mentioned in my previous notes, with but little difference in the results. On the whole we prefer to pot early in January, but as it is not always convenient to do so, then it may have been of service to many to know they could be safely potted at the time named, provided they were treated in the way recommended—viz., "placed in a cool pit and shaded for a few days." If the word "loose" had been substituted for "old" soil, it might have prevented any possible misunderstanding arising on that point. When potting we do not shake all the old soil away—that depends altogether on the state of the roots of each individual plant. If the plants have been in small pots, when turned out the balls are one mass of roots, from which it would be difficult to shake away any soil without completely tearing to pieces the network of roots, and this no intelligent cultivator would think of doing. When we find plants in this condition we simply remove the drainage and repot into larger pots. In other cases the soil is loose and roots not very plentiful: then we shake the exhausted and perhaps sour soil quite away, preserve all healthy roots, pot carefully, attend to regularly, and have the satisfaction of knowing we have done nothing so dreadful as Mr. Jenkins would have us believe. In conclusion I may say that I would not hesitate to shift a Lily into a larger pot after it had made 12 inches of growth if I thought better results would follow such shift—as I feel sure the plants would sustain no perceptible check if treated as recommended at p. 558. *H. W. Ward.*

FIG. 101.—*PICEA ORIENTALIS*: CATKINS BRILLIANT CARMINE.

sets in, they do take a little fruit, but this cannot be laid to the charge of those that are the most useful. Among these may be mentioned the hedge-sparrow, wagtail, and wren, and tomits are exceedingly valuable in scouring trees for maggots, and when they have young they may be seen plying backwards and forwards continually with insects in their bills—the number they devour daily being something very considerable. Returning again to the fruit, the only fruit crops which are heard of are Morello Cherries, Gooseberries, and Currants, and perhaps Raspberries, the first-named being set well, and swelling fast. Of Plums there are very few, and Apricots are in the same category, whilst Peaches and Nectarines are only passable on trees that were well protected, and where the aspect is a warm one; Strawberries are thin of bloom, but this is due to the great heat and drought of last autumn, which prevented the plants from making their growth, and forming strong crowns. *J. S.*

REPOTTING LILIES.—In criticising my recent notes on potting Lilies, Mr. Jenkins has fallen into the common error of over-stating his case, and in doing so travels beyond the region of facts. When he asserts that "a worse time could not possibly be selected" for potting the plants than that which I recommended, he is certainly making a random

ENGLISH TOBACCO.—In the synopsis of the judges upon the manufactured British grown Tobacco, confirming the award of the first prize to it, it is stated that the report about to be furnished by the experts through the agency of the London Chamber of Commerce "will not be favourable to the growth of Tobacco in England, inasmuch as, amongst other objections, there was an excess of moisture in all the samples exhibited, and not a single lot was in really merchantable condition." It is not our desire to champion the subject, but as we have made exhaustive experiments during the past two seasons, at a cost of several hundred pounds, all we ask is that the British-grown Tobacco may have fair consideration; and we venture to say that a mistake has been made, either by the London Chamber of Commerce or by those responsible for fixing the date of the trials, from the fact that it is impossible for Tobacco grown during the summer of 1887, either in the British Isles or in those countries from which our principal supplies are obtained, to be in a merchantable condition in the month of May, 1888. Tobacco grown in the United States has to pass through what is known as the "May sweat," and to bring the British Tobacco into marketable condition it was equally necessary that it should have passed through a similar process, and thus brought into a condition to be fairly compared with Tobacco from other countries. We, therefore, maintain that the competition should have taken place, say, about the month of September next, by which time, as we understand, the first importations of the American Tobacco crop of 1887 might be expected to reach the manufacturer in England. It is clear from this point of view that the experts have not only committed an error of judgment in submitting the English-grown Tobacco to a final test at the present time, but they have also, upon an unsound basis, compiled a discouraging report, which we think must have the effect of limiting future experiments. *James Carter & Co.*

LATHYRUS DRUMMONDI.—The capacity of this lovely everlasting Pea to increase in strength and dimensions is well shown in a big clump I have here. But a few years ago it was a small plant put out to cover an old tree stem. Now it needs quite an armful of Pea sticks to support it, and is a dense mass of growth 6 feet by 5 feet, and daily increasing in size; indeed, in a week or two, when in full bloom, it will be fully 20 feet in circumference. This everlasting Pea is apparently incapable of variation, as it keeps so true to character from seed, although forms of *Lathyrus latifolius* are growing close by. It also seeds fairly well, but I prefer to sow seed as soon as ripe, or at least during the autumn, as being so hard

they take a long time to germinate. Once secured, the plants seem to be almost indestructible. *A. D.*

RANUNCULUS LYALLI.—Herewith I send you a photograph of a plant of *Ranunculus Lyalli* which has just flowered at Glasnevin. It bore seven flowers, and the first to open was by far the finest, it being quite as large as a half-crown piece. About six years ago I received an imported crown, which was potted and placed in a cold frame facing north, in which position it remained until last year, when it was moved to another frame. Each year it produced two leaves, these being about 6 inches in diameter, and quite saucer-shaped; but this spring it sent up a fine strong inflorescence, and with it it produced two more leaves, so that now the plant has four leaves, and seems very healthy, although it has been in flower for three weeks. *F. Moore, Glasnevin.*

LADY DOWNE'S GRAPES.—I send you a bunch of Lady Downe's Grapes which I think you will consider are in good condition after being kept in bottles of water for close upon six months. These Grapes were cut from the Vines about Christmas, and will now (June 12) bear comparison with many samples of new Grapes. Sometimes we hear Lady Downe's spoken of as a second-class Grape, but so long as the variety can be kept in good condition until June, it must be regarded as a first-class Grape. *A. Bradshaw, Davenham Gardens, Malvern.* [The flavour was excellent, and the bloom on the berries and general appearance all that could be desired. *Ed.*]

CLIMBING DEVONIENSIS: WAS IT A SPORT OR A SEEDLING?—The following particulars might elucidate this matter. From H. B. Elwanger's excellent book on *The Rose*, in the catalogue part, we extract:—"Climbing Devoniensis: vig. Cl. T. S. J. Pavitt, 1858. (Sent out by Henry Curtis.) A sport from Devoniensis," &c. From Mr. Curtis, who is now nearly blind, I have ascertained that this statement in Elwanger's book is quite accurate. Mr. Curtis saw climbing Devoniensis first about the year 1855 in the neighbourhood of Clifton, and found on enquiry that "Old Devoniensis" had been budded on the strong-growing "Celine" stock, which Mr. Curtis had recently introduced as a strong stock for budding Teas on. From this operation of budding Devoniensis on the Celine the bud had first ran blind; buds from the blind shoot were again placed in the Celine stock; and so the sport was fixed. *Alfred Chandler, Curtis, Sandford & Co., Devon Rosery, Torquay.*

DISEASED ONIONS.—The three samples of Onions sent are infested with fungus, a disease which is very destructive of spring Onions in the district around Edinburgh. It is worst on light land. One of the samples is from sandy soil—practically sand blackened with generations of manuring. The sample No. 2 is from light sandy loam on much higher ground; and that numbered 3 is from a more holding soil—but still a loam—of rather light character. If you can throw any light on the cause of the disease, or suggest a cure, you will do a service to many of the *Gardeners' Chronicle* readers in this neighbourhood. The disease is commonly known here as Onion-mould, and only attacks autumn-sown crops. Samples 1 and 3 were sown after Potatoes, sample 2 after Cabbage; so that succession influence appears to be nil. *W. Sutherland.* [We sent these to Mr. W. G. Smith, who sends us the following note. *Ed.*]:—"The Onions are infested with the too well-known 'Onion-mould,' *Peronospora Schleideniana*. Your experience as to this fungus only attacking autumn-sown crops is contrary to ours. Onion growers generally prefer autumn sowing, so that the Onions may not only be too large for total destruction in the early summer by the *Peronospora*, but that they may also be too large for entire destruction by the Onion fly. Perhaps some experienced Onion growers will give an opinion on this point. The plants cannot be cured; prevention must be sought for."

THE FERTILISATION OF SCARLET RUNNERS.—It is rather a remarkable fact that with rows of both scarlet and white Runners growing side by side scarcely any evidence of crossing is found in the seed of either—as a rule I think none. The same fact holds good, I believe, in French Beans and Broad Beans; and it is also the case with Peas, which are purely self-fertilising, as no flowers are more difficult of access to insects. There is always a tendency to credit insects with performing some very wonderful things in the economy of Nature, but I fancy Nature could get along pretty well all the same without that aid. The tendency is one of exaggeration, or

rather of a desire to make much out of very small things. Generally Nature performs her part without much aid, and very often, when insects are credited with this or that good, Nature has accomplished her work rather in spite of them than with their help. Possibly because I am far from being an enthusiast in small things, I am somewhat sceptical in small matters, and thus do not regard bees as such wonderful philosophers after all. *A. D.*

DIMORPHISM IN TILLANDSIA.—In connection with the description and illustration (fig. 93, p. 717) of *Tillandsia virginalis*, I should like to point out the fact that a somewhat similar dimorphism is alluded to in Ball's *Notes of a Naturalist in South America*, p. 307, where he alludes to it in the following words:—"Among the many new forms of vegetation here seen the most singular was that of *Tillandsia*. Long, whitish, smooth cords hang from the branches of the taller trees, and at 8 or 10 feet from the ground, abruptly produce a rosette of stiff

branches overhead, must often adopt means of dangling down, in order to get clear of the leafage of their foster plants, the trees on which they grow. In tropical countries many Orchids dangle by means of their long aerial roots, many feet or yards even below the branches to which they are attached, and seemingly for the same reason as the *Tillandsia* mentioned by Mr. Ball hung by its cord-like stems from the trees in Southern Brazil. *F. W. Burbidge.*

DR. BENNET'S GARDEN, MENTONE.—Those who know Dr. Henry Bennet's garden at Mentone will say that you have not too highly praised the *Pinus canariensis*, figured at p. 721, *Gardeners' Chronicle*, June 9 last. Dr. Bennet has several very fine specimens of this tree about 30 feet high, which were planted about twenty years ago, and I have often heard him regret that he had not more extensively planted that Pine tree when he began to turn the side of a mountain into a garden. *E. J. Tilt.*

THE TOOTHWORT (LATHRÆA SQUAMARIA) is now flowering freely in copses in Kent. It is a curious parasite, found most commonly on the roots of the Hazel, with bluish flowers streaked with purple and red, but in colouring it is very variable. There are no leaves, simply a few fleshy scales, and the whole plant wears an indistinct rosy hue. It is a rather rare British plant, and one of peculiar interest. *A. D. Webster.*

STRAWBERRIES.—A recently issued list of Strawberries from one of our chief Northern growers shows how limited, after all, are our more popular varieties. The list includes fifteen only, divided into early, mid-season, and late, in sections of five each, but still somewhat arbitrarily, as I find Marguerite included in the early section; President, usually fairly early, in the second list; and Sir Charles Napier, a popular mid-season variety, in the late list. But the chief interest in the entire list centres in the fact that the most popular kinds are limited to some half-a-dozen, in spite of the fact that almost scores of new ones have been put into commerce during the past thirty years. The obvious moral seems to be, that in raising new kinds some very special knowledge of the requirements of Strawberry growers is needed. It is stated in this list that Sir Joseph Paxton enjoys the honour of furnishing 50 per cent. of our market produce in Strawberries. That is probably true, for, whatever its defects, it is a most popular variety, and it is specially satisfactory to find that an illustrious horticulturist is thus worthily remembered. But with Sir Joseph Paxton—certainly the "Paxton" of the ordinary grower—we find Sir Charles Napier—or the commonly termed "Napier"—coming next in point of importance; then, perhaps, comes President, and next Vicomtesse Héricart de Thury, followed by British Queen, and, last of a half-dozen, Elton Pine. There is nothing very novel about any of these—in fact, all seem to have been with us for a generation, although not in all cases quite so old. But the list includes Keen's Seedling, Marguerite, Filbert Pine, and Eleanor—all old enough indeed; and when to these are added British Queen and Elton Pine, we are carried back to varieties popular fully thirty years since. If some half-dozen of the very moderate sorts are taken from the list, we find that our selection of first-class strawberries is after all but a limited one. Although most persons will agree in the assertion that half a dozen sorts are ample for any garden. Superior variety as Sir Joseph Paxton may be, yet it is not without its faults, especially its tendency to mildew, whilst the fruits if large, rich coloured, and sugary, are not by any means too highly flavoured. A variety which included all the best properties of Paxton, with the hardness and firmness of fruit found in Napier, and the richness of flavour of British Queen, is an undiscovered joy. It does seem obvious that in obtaining large fruited forms we have gained nothing in flavour, and rather have lost much; therefore it seems to be a mistake for raisers to seek for size when it can only be gained at the expense of flavour. On the other hand, if we could but induce Vicomtesse Héricart de Thury—which is both so early and so admirably flavoured—to give a little more of size in its later fruits we should have in that variety almost an ideal early kind. When it seems to exhaust its energies in the production of just a few large and numerous small fruits there is something which may be improved upon. It is pretty evident that in the raising of new kinds of Strawberries we have made no appreciable advance during the present generation, and there is yet room in which the raiser may hope successfully to labour. *A. D.*

FIG. 102.—*ABIES AMABILIS*: CATAKIS SOLITARY, LATERAL, YELLOWISH.

leaves, like those of a miniature Pine-apple, with a central spike of flowers." In a footnote Mr. Ball states "The species common here (*viz.*, at Santos, South Brazil) is allied to *Tillandsia stricta*, but is not, I think, identical." The occurrence of dual stages of vegetative development is very marked amongst our own native plants in *Hedera*, *Ranunculus*, and *Sagittaria*, while, in the Tropics, the species of *Eichornia*, *Ficus*, and of Aroids, like *Pothos*, show dimorphic growths of considerable interest. The main object of such growths seems to be economy of material, as little energy and material as possible being expended, and that only in the direction of light and air, or moisture, until the conditions favourable to the flowering and fruiting stages of the plant's existence are reached. In dense tropical forests, or even in lower single growth, "climb or die," is the gospel preached by Nature to all the lowly forms of plant growth whose existence and reproduction depend on sunshine. Figs and Aroids (the fleshy fruits of which fall to the ground) are often fated to climb for bare life; while Orchids and *Tillandsias*, which produce light, sawdust-like seeds that often adhere and germinate on the wet

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, JUNE 12.—The display on the above occasion was exceedingly interesting as a whole, the Drill Hall being fairly well filled with Orchids in bloom from private and trade establishments; large numbers of hardy herbaceous plants, many really fine "gardeners" plants, but little seen and scarce in nurseries, from the Royal Gardens, Kew; Rhododendrons as cut blooms, tuberous Begonias, Scotch Roses, variegated tree and shrub foliage, and Ivy-leaf Pelargoniums from the Society's Garden, Chiswick.

Floral Committee.

Present: G. F. Wilson, Esq., F.R.S., in the chair; and Messrs. J. Laing, G. Nicholson, H. Herbst, W. Bates, T. Baines, C. T. Druey, R. Dean, C. Noble, C. Pilcher, J. Doinny, H. M. Pollett, J. O'Brien, A. F. Lendy, B. Wynne, H. Ballantyne, E. Hill, W. Wilks, W. Goldring, S. Hibberd, W. Wildsmith, and J. Walker.

Orchids.—The President of the Society, Sir Trevor Lawrence, Bart., M.P., exhibited some choice subjects, viz.:—*Masdevallia Harryana regalis*, a many-flowered specimen, with bright crimson large blooms; *M. H. sanguinea* and *M. H. atro-sanguinea*, similar in colour, but smaller as regards its flowers; *M. H. maxima*, also of a crimson colour; *Cattleya Mossii* *superba* was a grand plant, the colours of the lip and petals and sepals being very intense; *Vanda Lindenii*, flowers green with yellow margin; *Cypripedium Stonei* var. *grandiflora*, a very fine piece, with three flowers, the dorsal as well as the lower sepal having fine large proportions; *C. Wallisii*, as cut blooms, was likewise shown; and a pretty plant of *Trichopilia crispa marginata*: the flower has a thread-like edge to the tube. Good *Odontoglossum Alexandrae* were included in the Burford collection.

Messrs. Low & Co., Clapton, exhibited many examples of their new *Cypripedium bellatulum*, one of which was named *roseum* from a tender hue of pink which suffuses its flowers; but all of the species showed small differences in form or markings. *Phalænopsis gloriosa*—several plants differing from *P. amabilis* in the rose colour at the base of the lip, and the crimson streaks in the throat; it is a beautiful flower: for full description, see *Gardeners' Chronicle*, May 5 last. Many *Cattleya Mendelii*, *C. gigas*, and *C. g. Sanderiana*, were found in the collection; examples of *Dendrobium Bensonianum*, *D. Devonianum*, both well flowered; *Vanda Roxburghii*, *Vanda teres*, good *Calanthe veratrifolia*, and several new varieties of *Cypripedium*, comprised the chief feature of Messrs. Low's collection. (A Silver-gilt Banksian Medal.)

Mr. B. S. Williams, Holloway, staged an ornamental group, consisting mainly of Orchids, interspersed with Tillandsias, small Palms, Ferns, *Dracaenas*, *Sarracenas*, &c.; many choice *Cattleya Mossii* and *C. Mendelii* were observed; *Odontoglossum luteo-purpureum*, *O. vexillarium splendens*, a nice piece of *Vanda teres Andersoni*, an improved *teres*; *Cattleya Schilleriana* with two flowers, *Lælia purpurata*, a species this nursery is very rich in; *Scuticaria Hladwenii*, with one flower; *Odontoglossum constrictum*, and several *Oncids*. (A Silver Banksian Medal.)

Messrs. Sander & Co., St. Albans, exhibited a new *Acineta*, white, densely spotted with minute lilac spots, almost effacing the ground colour; the spike of flowers was a foot long, and bore thirteen flowers widely placed. *Odontoglossum nebulosum excellens* is a flower milk-white in all its parts, with the lower half of all portions of the flower covered regularly with round spots of a dark shade of brown. A splendid plant of *Dendrobium Dalhousianum*, 3 feet high and 3 feet wide, and full of flowering stems; *Odontoglossum cordatum*, *O. Pescatorei*, *Cattleya Acklandia*, and several minor subjects completed the group. (A Silver Banksian Medal.)

Lælia Wyattiana was shown by G. Nevile Wyatt, Esq., Lake House, Cheltenham (gr., Mr. Simcoe). It is like a weak pale form of *Lælia purpurata*. He also had *Odontoglossum Cervantesi giganteum*, distinguished by its very large size.

From Rev. J. P. Way there came a plant of *Oncidium Gardneri* var., with a bright yellow lip bearing a zone of brown towards the margin, sepals and petals brown with a yellow border. A well flowered plant of *Oncidium crispum* var. *grandiflora* was shown by Mr. Page, Teddington.

From Mr. Ballantyne, gr. to Baron Schroder, The Dell, Egham, came a plant of *Cattleya Wagneri superba*, very well flowered: the flowers (pure white with the lip yellow) are of fine substance and very large; also *Sobralia xantholeuca*, rich creamy-yellow.

From the gardens of the Duke of Marlborough, Blenheim, Woodstock, came a large plant of *Lælia purpurata blenheimensis*, darker than the type; lip very good colour.

From M. Linden, Brussels was sent a plant of *Dendrobium macrophyllum* var. *Bleichroderianum*—flowers bright apple-green, marked heavily with red-brown, and a spot of carmine at the base of the column; *Odontoglossum luteo-purpureum Boddartii* was also sent by M. Linden.

A magnificent form of *Odontoglossum Halli* called *magnifica* came from H. M. Pollett, Esq., gr. Mr. Parks, Farnside, Bickley; it has a very large flower, and the lip is remarkably wide. Also *Cattleya Mendelii bickleyana*, white, anterior lobe of the lip lake, throat yellow.

A plant of *Oncidium Wentworthianum*, bearing many flowers, came from Mr. J. Douglas, Great Gearies, Ilford.

Miscellaneous.—Three beautiful double varieties of tuberous Begonias came from Messrs. H. Cannell's garden at Swanley; Mrs. W. B. Miller, a pink and buff-coloured flower, new in tint, and a fine hold flower, obtained a certificate; the others were Mr. Miller, a scarlet, and Cannell's Triumph, an exceedingly pretty vivid pink variety.

A good show was made by Messrs. Paul & Son, Waltham Cross, with *Rhododendron hybridum* blooms and *Azalea mollis* in small flat baskets, consisting of many of the best known sorts; baskets of cut blooms of Scotch and miniature Roses, considerable quantities of tree foliage of a variegated character, came from this exhibitor.

Fine showy stands of *Pyrethrum* were put up by Messrs. Kelway & Sons, Langport. These consisted of single and double flowered varieties raised at Langport. The choicest were *Princess Beatrice*, rosy-crimson, single; *Meteor*, a brilliant scarlet; *Wega*, white, yellow centre, double; *Princess Irene*, single, white, yellow centre, double; *Princess Irene*, single, white; *Aphrodite*, also white, double; *Florentine*, double, pale lilac; and *Lord R. Churchill*, deep carmine. Messrs. Collins Bros., & Gabriel also showed *Pyrethrum*, some of which were bright in colour.

Some few subjects of a hardy character came from the gardens of G. F. Wilson, Esq., Oakwood, Weybridge; these were *Fragaria lucida*, a sweet-scented shining-leaved Strawberry; *Edelweiss*, from the seed-bed; *Ourisia coccinea*, *Henckera sanguinea*, *Cypripedium spectabile*, *Solanum crispum*, with flower light blue; *Primula sikkimensis*, and *Sarracenia purpurea* in bloom. Other plants from the same garden were sent, but not for inspection by the committee, viz.:—*Primula prolifera*, an Indian species; *Acacia melanoxylon* with pinnate and whole leaves. A large number of varieties (40) of Ivy-leaf Pelargoniums came from the garden of the Society, comprising the best in cultivation, and showing—many of them—varieties of great decorative value.

Messrs. Paul & Son, Cheshunt, sent a collection of alpine and other plants. *Saponaria ocyroides splendens* made a good display; *Campanula pulla*, with its large flowers borne singly, was fine; but *Rosa alpina pyrenaica*, about 6 inches in height with a flower of rich rose about 2½ inches in diameter, was a conspicuous object. *Ramondia pyrenaica alba* (pure white), the white *Linaria anticaria*, *Aster diplostephioides* (blue rays), *Rosa sinica* (white), *Dianthus cæsius*, and *Rhododendron Fortunei* were also good plants. Various *Rhododendrons* of the ponticum section, with hardy *Azaleas*, and *Pæony montan*, were also well shown by this firm, making a very effective display. (Silver Banksian Medal.)

Miscellaneous cut flowers were shown in force by Messrs. Barr & Son, King Street, Covent Garden, W.C., and by Mr. T. S. Ware, Hal: Farm Nurseries, Tottenham, the former of whom received a Bronze Banksian Medal for a collection embracing a great range of flowers. Irises in variety formed one of the leading features. *I. susiana* was well shown, *I. aphylla* var. *Madame Chereaux*, white, bordered by blue-mauve; and *Comte de St. Clair*, a form of *I. amœna*, with falls white, heavily lined with purple, and a purple blotch, standards white faintly suffused by mauve, were the most noticeable; other things included gorgeous *Papaver orientale* and *P. nudicaule* in variety. *Pæonies*, of which *P. officinalis Sunbeam*, a good formed flower, rich rosy-carmine, and *P. Broteri* (see *Gardeners' Chronicle*, p. 49, July

10, 1886) were conspicuous; *Arum crinitum* was also shown here. Mr. Ware also had a good collection of Irises and Iceland Poppies, and he also had quantities of *Heimerocallis flava* and *Centaurea montana* varieties; *Pyrethrum*, *Silene virginica*, *Ixiolirion tartaricum* (rich blue), *Stocks*, *Cypripedium spectabile*, &c., were also shown, and a Silver Banksian Medal was awarded.

A similar recognition was made to Mr. J. Walker, Whitton, Middlesex, for an extensive collection of finely grown Irises, embracing most of the popular varieties. The arrangement of each bunch was effective, and the group, as a whole, very pleasing. *I. germanica* (the type) was as fine as any of the varieties, and *I. g. atropurpurea*, a violet-purple, was also good; other good sorts were *I. pallida Imogene*, pale blue; *I. variegata Minico*, yellow, with brown falls; *I. aphylla Madame Chereaux*, mentioned in Mr. Barr's group; *I. a. Queen of May*, delicate lilac.

Mr. F. Ross, Pendell Court Gardens, Betchingley, Surrey, showed *Rosa luteo-punica*, the Austrian Brier, a richly coloured flower; *Fortune's Yellow Rose* (which was also shown by T. W. Girdlestone, Esq., Berkhamstead), a very pretty reddish-yellow flower, double, and without any approach to formality. Mr. Ross also showed specimens of *Mackaya bella*, freely flowered.

A capital collection of plants was shown from the Royal Gardens, Kew, embracing *Cirrhoetalum Cunninghamii*, dark rosy-lilac; *Masdevallia muscosa*, more interesting than pretty; *Lissochilus Krebsii*, bright yellow and brown. Leaving Orchids, there were *Solanum crispum*, a hardy shrub, with pretty pale blue flowers; *Onosma tauricum*, a scape of *Musa coccinea*, very bright scarlet; *Thunbergia mysorensis*, yellow and brown—very strange-looking; *Rhododendron Blandfordæiflorum*, a species with small pale lilac flowers; *Lobelia nicotianifolia*, *Saxifraga Valdensis* (in full flower), and *Nymphaea Lotus*, *N. stellata*, *N. tuberosa* var. *marliacea*.

From Messrs. H. Low & Co., Clapton, there came an excellent group of *Ericas* in pots (market plants), profusely flowered, and in fine health. They were chiefly varieties of *E. ventricosa*, and attracted much attention. A Silver Banksian Medal was awarded.

Brompton Stocks of large size and clear colours (red and white) were well shown by Mr. R. Dean, Ealing, W.; and Mr. S. Barlow, Stakehill House, Castleton, Manchester, sent Tulips, breeders and rectified, of great beauty and fine form.

A group of tuberous Begonias staged by Messrs. J. Laing & Sons, Forest Hill, S.E., contained some fine varieties, of which *H. Adcock*, rich carmine, double, with small guards; and *Camellia*, very slightly paler, were excellent; *Anak*, rich rosy-pink (double), and *Duchess of Bedford* (single), carmine, with white centre; *Duchess of Teck* (double), yellow, were also good. Messrs. Laing also had the new *Cypripedium bellatulum* and *Gloxinia virginialis*, pure white. A large number of finely grown showy Pelargoniums in full flower were shown by W. Clay, Esq., Grove Road, Kingston (gr., Mr. Hibbert).

Mr. B. S. Williams, Paradise and Victoria Nurseries, Upper Holloway, N., had *Sarracenia Williamsii*, pale green veined with red-brown, dwarf and rather wide in the tube; also *Asplenium ambouensis*, of no great beauty, with dark green fronds.

Mr. A. Waterer, Knaphill Nurseries, Woking, showed a good lot of *Rhododendron ponticum* varieties, of rich colours and large trusses; and also a number of equally fine hardy *Azaleas*.

Anthurium Desmetianum was shown by Mr. J. Liuden, Brussels; the spathe is of a beautiful intense red, and the leaves long, acute at the apex, with a cordate base.

Messrs. J. Veitch & Son, Chelsea, contributed an interesting group of plants, the most noticeable of which was *Styrax Obassia*, with racemes about 6 inches in length, bearing large white flowers; leaves round or slightly cordate, roughly toothed towards the apex—a truly beautiful plant; *Styrax japonica*, *Aciphylla squarrosa*, in flower; and *Grevillea sulphurea*, illustrated in our issue for Oct. 9, 1886, were also shown, as well as *Azalea coccinea speciosa*, brilliant orange-red; and numerous named *Rhododendrons*; *J. Whitworth*, dark lake; *Mrs. J. Clutton*, white; and *Sir Arthur Guinness*, rose, were fine forms.

The white *Nelumbium* was shown from Mr. Bolas, Hopton Hall Gardens, Wirksworth, Derby. A page illustration of this was given in our issue for Oct. 9, 1881, from a specimen supplied by Mr. Bolas.

FIRST-CLASS CERTIFICATES.

To *Cattleya Wagueri superba*, from Baron Schroder.
 To *Begonia Camellia*, from Messrs. J. Laing & Sons.
 To *Begonia Hadcock*, from Messrs. J. Laing & Sons.
 To *Sarraceni Williamsix*, from Mr. B. S. Williams.
 To *Ranondia pyrecaica alba*, from Messrs. Paul & Sons.
 To *Begonia Mr. W. B. Miller*, from Messrs. H. Cannell & Sons.
 To *Pyrethrum Wega*, from Messrs. Kelway & Sons.
 To *Pyrethrum Meteor*, from Messrs. Kelway & Sons.
 To *Pyrethrum Beatrice Kelway*, from Messrs. Kelway & Sons.
 To *Styrax Obassia*, from Messrs. J. Veitch & Sons.
 To *Anthurium Desmetianum*, from Mr. J. Linden.
 To *Odontoglossum Halli magnificum*, from H. M. Pollet, Esq.
 To *Odontoglossum nebulosum excellens*, from Messrs. F. Sander & Co.
 To *Phalanopsis gloriosa*, from Messrs. H. Low & Co.
 To *Cypripedium bellatulum roseum*, from Messrs. H. Low & Co.

BOTANICAL CERTIFICATE.

To *Dendrobium macrophyllum Bleichroderianum*, from M. Linden.

Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. J. Lee, H. Weir R. D. Blackmore, S. Ford, G. W. Cummins, C. Howe, G. T. Miles, A. H. Pearson, W. Warren, W. Marshall, J. Roberts, J. Smith, J. Wright, R. Hogg, P. Crowley.
 A new Cucumber, Lockie's Perfection, was shown by Mr. Lockie, Oakley Court Gardens, Windsor, which was certificated: it is a hybrid between Verdant Green and Purley Park Hero, long, uniform, very short neck, dark, and heavily bloomed, and internally solid, and of good colour.
 Mr. Miller, gr. to the Right Hon. Lord Foley, Ruxley Lodge, Esher, showed some excellent Peaches; and Melons came from Mr. Gleeson, Clumber Gardens, Worksop—a cross between Luscius and Melting and Hero of Lockinge; it was good size, but only of average merit.

FIRST-CLASS CERTIFICATE.

To Cucumber Lockie's Perfection, from Mr. T. Lockie.

BATH AND WEST OF ENGLAND AGRICULTURAL.

JUNE 6, 7, 8, 9, AND 11.—The horticultural department was, as usual, under the superintendence of the Hon. and Rev. J. T. Boscawen. Contributions of plants were sent by Mr. P. A. Pettigrew, gr. to the Marquis of Bute; Mr. S. E. Miller, gr. to F. Sayart, Esq., Old Sneyd Park, Bristol; Mr. G. W. Rye, gr. to James Derlaw, Esq., Sneyd Park; Mr. G. W. Hancock, gr. to H. W. Summis, Esq., Tellisford House, Clifton; Mr. G. C. Parker, gr. to — Watson, Esq., Newport; and Mr. G. Gibbins, gr. to E. Lee, Esq., Coldra, Newport. These were all placed at the disposal of the Hon. and Rev. J. T. Boscawen, the Steward of Horticulture, and consisted of large Palms, stove and greenhouse foliage and flowering plants, and Orchids in great variety. They were arranged in two large groups down the centre of the tent in a manner unusually seen at horticultural exhibitions—not stiff and formal, but taking Nature for their model, the effect being charming.

The great centre of attraction was the two large groups of Orchids which were put up in competition for a £10 prize, offered by the Society. Mr. James Cypher, Exotic Nurseries, Cheltenham, was deservedly placed 1st, with a magnificent collection. The different varieties had all fine examples, including *Aërides Lobbi*, *Cattleya citriua*, C. Mendelii, C. Mossia, and C. Skinneri; *Cypripedium biflorum*, C. nigrum, C. Dominii, C. Hookera, C. Lawrenceana, good form; C. niveum, and C. Stonei; *Dendrobium Bensoni*, D. Dalhousieanum eburnum, D. Falconeri, D. Jamesianum, especially good; D. Parishii, D. thyrsofolium, D. tortile rosem; *Epidendrum plematocarpum* and E. vitellinum majus, both excellent examples. There were about thirty plants of *Lælia purpurata*, a mag-

nificent lot of flowers; others were *L. majalis*, *Masdevallia Harryana*, M. *Reichenbachia*, M. *Shuttleworthii*, and M. *trichilium*. *Odontoglossum*s consisted of the species and varieties. O. *Alexandra*, a beautiful lot; O. *citrosimum*, O. *cordatum*, O. *nebulosum*, O. *Pescatorei*, O. *Phalanopsis*, O. *Rozelii*, and O. *veixillarium*. A few specimens of *Oncidium concolor*, *Thunia alba*, *Vanda suavis*, and *V. tricolor*, completed the list. It is rare to see at any of our horticultural exhibitions such a grand lot staged.

Messrs. Heath & Sons, Cheltenham, were the other competing nursery firm, which had a great variety, including grand pieces of *Cattleya Mossia*, *Phalanopsis amabilis*, &c.

For specimen Orchid (prize £5), Mr. Cypher was again placed 1st, with *Lælia purpurata*, with grand flowers; Messrs. Heath staging a splendid piece of *Cattleya Mossia*, eighty-four blooms, as the other competitor.

For cut blooms of Roses—prize, a Silver Cup—Mr. J. B. Hall, Rockferry, was placed 1st, with an excellent lot, including *Niphetos*, *Comtesse de Nadaillac*, *Maréchal Niel*, *Souvenir d'Elise*, *Madame De Watteville*, *Madame Margottin*, *Aona Ollivier*, *Marie vao Houtte*, *Princess of Wales*, *Etoile du Lyon*, *Belle Lyonnaise*, *Souvenir d'un Ami*, *Rubens*, *Madame Lambert*, *Jean Peract*, *Hon. Edith Giffard*, and *Comte de Paris*.

Several other grand boxes of Roses were staged, but some mistake occurred in entering them, so that they could not be placed for competition.

Messrs. Smith, of Worcester, sent a grand lot of trained specimens of *Clematis*, finely flowered, including *Countess of Lovelace*, *Marie Defoe*, *Sensation*, very large blue flowers; *Venus victrix*, double blue; *Gloire de St. Julien*, Mrs. G. Jackmao, white; *Lord Neville*, *Lucy Lemoine*, *Marie Lefevre*, *Excelsior*, and *Barillet des Champs*, a fine double; also a group of *Rhododendrons*, *Kalmias*, and *Azalea mollis* in variety.

Messrs. Laing, of Forest Hill, London, sent a fine collection of double and single flowered tuberous *Begonias* with remarkably fine flowers; *Gloxinia virginalis*, white; and some new *Caladiums*.

Mr. F. Hooper, Bath, set ten boxes of Pansy bloom in great variety—very fine and choice flowers. Messrs. Parker & Sons, St. Michael's Hill, Bristol, had a large collection of cut flowers, arranged in epergnes; bridal and other bouquets, brackets, &c., composed of choice kinds of flowers, principally Orchids and Roses, artistically arranged.

READING HORTICULTURAL.

JUNE 6.—In common with other societies that of Reading has to suffer for lack of large specimen plants. Collections of these once grown about this busy Berkshire town have become dispersed, and other exhibitors do not come forward to fill the places with fresh subjects, and the fact that the place of show within the Abbey walls at Reading is a Regent's Park in miniature, makes it very necessary that some large specimens should be present, and their absence imparts an unfurnished appearance to the whole; but there are always good features at the Reading shows, and they appear to be as popular with the townsfolk as ever.

Stove and Greenhouse Plants.—On this occasion Mr. Mould, nurseryman, Devizes, and Mr. H. James, nurseryman, Lower Norwood, were the exhibitors of nine each, the prizes being awarded in the order of the names. Mr. Mould's best plants were good specimens of *Erica Cavendishiana*, E. *aristata*, *Franciscea calycina major*, a capital *Clerodendron Balfourianum*, *Dipladenia profusa*, *Darwinia fuchsoides*, and the ever-welcome *Epacris miniata grandiflora*. Mr. H. James had *Erica ampullacea obbata* and E. *tricolor* *Wilsoni*, two varieties of *Anthurium Scherzerianum*, the old *Polygala Dalmaistana*, well flowered; *Azalea Roi d'Hollande*, &c.

In the class for four plants, Mr. Armitage, gr. to W. Clark, Esq., Reading, was 1st. The best specimen was an excellent piece of *Clerodendron Balfourianum*, from Mr. Baskett, gr. to W. J. Palmer, Esq., Reading; Mr. Woolford, gr. to W. A. Palmer, Esq., Reading, being 2nd, with an unusually good piece of *Anthurium Andreanum*.

Orchids.—These, as usual at Reading, were bright and attractive, and the culture of these appears to be developing in the neighbourhood. In the class for three plants, Mr. H. James was 1st, with a well-flowered and finely-coloured *Cattleya Warneri*, *Cypripedium barbatum superbum*, and *Dendrobium thyrsoflorum*. Mr. Baskett was a good 2nd with a

fine piece of the latter and a well-grown specimen of *Aërides Fieldingii*. Two or three extra prizes were awarded in this class. The best specimen was *Dendrobium nobile*, from Mr. Pound, gr. to G. May, Esq., Reading; Mr. H. James coming 2nd, with *Cymbidium Lowii*.

Azaleas were smaller than usual, though bright and effective. Mr. Lockie, gr. to G. Fitzgerald, Esq., Oakley Court, Windsor, carried off the leading prizes in two classes.

Rhododendrons.—Prizes are offered for groups of *Rhododendrons*, and they make a very fine feature. It is, however, but few who can stage a collection. On this occasion, Mr. Turton, gr. to J. Hargreaves, Esq., Maiden Erleigh, put up a highly meritorious group that formed a grand feature. Two or three more such collections would greatly help to effectually fill the large tent at Reading.

Flowering Plants.—*Pelargoniums* were, as usual, a good feature, Mr. Ashby, gr. to W. Fanning, Esq., Whitechurch, having the best nine plants, including the following fine varieties:—*Prince Leopold*, *Duchess of Edinburgh*, *Empress*, *Ruth*, *Bridal Bouquet*, and *Triomphe de St. Maude*.

Gloxias were in good condition, but the splendid specimens hitherto shown by Mr. Baskett were wanting on this occasion; though he was 1st with smaller plants of good quality; 2nd, Mr. Palmer, gr. to W. H. Dick, Esq., Thames Ditton.

Fuchsias were of a nice free growth, and carried flowers of excellent quality, Mr. Armitage having the best six plants.

Calceolarias were represented by fine strains, and well-grown specimens, and there was a close run between Messrs. Dockerill and Baskett for the 1st place.

Some good Roses in pots were staged by Messrs. Lockie and Baskett.

Groups arranged for Effect.—There were two classes for these. The best of the large groups came from Mr. H. James, arranged in a semi-circle, Palms and Orchids being employed to great advantage. Mr. Pound came in 1st, with the small group, Mr. Sumner being a good 2nd.

Foliage Plants.—With the exception of a good collection from Mr. H. James, there was but an indifferent representation of large specimens. Mr. James was 1st, with fine examples of *Trinax argentea*, *Macrozamia Dennisoniana*, and *Latania borbonica*, as the gems of his group. Messrs. Dockerill and Woolford were 1st and 2nd with four plants. Ferns were in sixes and fours, well-grown examples being generally present. *Selaginellas* were also a good feature.

Cut Flowers.—These were represented by some good Roses, stove and greenhouse and hardy flowers, Pansies, &c.—all highly creditable. Stands for the decoration of dinner-tables were, as they always are at Reading, remarkably well done, and Messrs. Philips were 1st in each class for garden and wild flowers. Mr. Phippen had a really magnificent bridal bouquet, and a very fine wreath. Buttouholes were also a good feature.

Fruit.—Black Grapes, the bunches shown in pairs, were remarkably good, Mr. Ashman, gr. to C. T. Crewe, Esq., Billingbear, being 1st, with Hamburgs. In the class for white Grapes Mr. Robins was 1st, with Foster's Seedling; Mr. Ashman being 2nd, with Buckland Sweetwater. Peaches were good for the time of the year; Mr. Robins was awarded the 1st prize for Alexander. The best Nectarine was Lord Napier, also from Mr. Robins. Strawberries were good, La Grosse Sucrée, from Mr. Goodman, being well finished. Messrs. Sutton & Sons offered prizes for their Melons, Hero of Lockinge being mainly shown in good character. Messrs. James Carter & Co. also offered prizes for Blenheim Orange Melon, one large fruit only being staged.

Vegetables were a striking feature. Messrs. Oakshott & Millard offered special prizes for six dishes, which brought a very keen competition, and they were shown of the best quality. Mr. Jennings, Farnborough Park was 1st, with Asparagus, Tomatos, Cucumber, Cauliflower, Peas, and French Beans; Mr. Lockie being very well up indeed with an admirable lot. Messrs. Carter & Co. offered prizes for their Model Cucumber, Mr. Lockie being 1st, with perfect samples, and he was also 1st in the competition for Cucumbers, staging two faultless fruit of Purley Park. Potatos, Mushrooms, Lettuce, &c., came also in good form. Mr. Bowie, gr. to A. W. Sutton, Esq., had a remarkable dish of Sutton's Perfection Tomato, which was highly commended; and Messrs. Oakshott & Millard had a lot of their Reading Defiance Cabbage, a valuable early variety.

THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending June 11, is furnished from the Meteorological Office:—

"The weather has been dull and very rainy over all the west and north-west parts of the kingdom, and generally cloudy, but with less rain, in the east and

south-east. In many parts of Great Britain, however, some intervals of clear sky have been experienced. Thunder and lightning prevailed at times in different parts of the country, but were not at all general.

"The temperature has been below the mean in all districts, the deficit at the more northerly stations being 3° or 4°. During the earlier days of the period the thermometer was very low, the maxima in some places being less than 50°; but as the week advanced the thermometer rose, and, on the 11th, maxima of 63° to 74° were recorded over Great Britain. The absolute minima (which were registered either on the 5th or 6th) were very low generally. Over the inland parts of Scotland they varied from 26° to 33°, and even in 'England N.W.' (Newton Reigny) temperature fell to 30°. In the other districts the minima ranged from 36° to 42°.

"The rainfall has again been less than the mean in 'England E.' but in all other districts an excess is shown. Over Ireland, the west of Scotland, and the south-west of England the fall has been very heavy.

"Bright sunshine has been less prevalent than it was last week, except in Scotland. The percentage of the possible amount of duration was very low generally; in Ireland it ranged from 11 to 13, in England, from 20 to 30, and in Scotland, from 22 to 33."

ENQUIRIES.

"He that questioneth much shall learn much."—BAAO.

BLIND NARCISUS POETICUS.—For some years I have been vainly trying to flower the double form of *N. poeticus*. It has grown well, formed a large clump, but the flowers never get beyond the stage of the buds enclosed. Can you suggest a cause? Nothing can be more vigorous than the plant, nothing more miserable than the attempt to flower. *D.* [We wish we could tell you; our own, whether double or single, always go blind. *Ed.*]

WHERE IS IT?—Professor Reichenbach sends us the following note, which tells its own tale:—"Professor Reichenbach has received from Mr. W. Stevens, Walton, Stone, a fine spike of *Odontoglossum stauroides* Gravesianum. As the geographical dictionary shows ten Stones and twenty-three Waltons in England, the kindness of the Editor appears to offer more hopes of bringing the name of the plant to the notice of Mr. W. Stevens than the wits of the helpless post officers."

NOTICES TO CORRESPONDENTS.

NOTICE.—Owing to pressure on our space the Royal National Tulp Society's Show report is omitted, and will be given in our next issue. Other articles are likewise delayed from the same cause.

ADIANTUM FARLEYENSE: *J. D.* Cut off at the base all the old fronds, and any young ones attacked by the scale. Take away the surface soil, and replace it with new.

BOTTOM-HEAT: *A. King.* You need not cover the hot-water pipes with water; it is not so good as placing them in a shallow chamber under the bed. There should be at the least six rows of 4½-inch pipes running the whole length of the pit. The floor of the bed may be of rough boards, slate, or thin stone slabs. The pipes should be supplied with comestable valves on flow and return pipes, so that the heat may be completely under control. Another mode of supplying heat is to place the pipes sufficiently low in the pit to allow of a bed of broken stone, which should graduate from those the size of a cricket-ball at the bottom, to small bean-like material at the top, being placed over them. On this substratum, tan, Oak leaves, and stable-manure, or soil itself may be placed according to the use to which the pit may be put.

CATERPILLARS: *J. S.* See last week's number, p. 723.

DAPHNE MEZEREON: *J. M. S.* You may layer side shoots; raise them from suckers or from seeds, or graft it on *Daphne laureola*, the Spurge Laurel of the woods.

DOUBLE-FLOWERED TURNIP: *R. V. & Son.* Very unusual. We will examine and report.

EMIGRANT: *W. K.* If you have a little money at command, you should do well in the colonies: Canada offers advantages, if you wish to follow your occupation of a gardener, whether you start on your own account after a time, or take a situation. See our last and present issue for communications concerning Florida and Queensland before deciding, and consult the authorities at the Emigration Office, Westminster.

HARDY CLIMBER, FAST GROWER, TO HIDE GABLE: *J. M. S.* If the box provided is a deep one Ivy or Virginian Creeper would grow to a large size in it, *Bignonia radicans*, varieties of Clematis, *Passiflora cœrulea* would also do well if you require flowering subjects.

LABURNUM SPORT: *Cytisus.* The specimens you send are those of the highly curious *Cytisus Adami*, concerning which so much has been written during the last thirty or forty years. It is supposed to have originated from budding *C. purpureus* on the common Laburnum. At any rate, your specimens illustrate the two species, and the intermediate forms. You will find an abstract of what has been written in the second volume of Darwin's *Variations of Animals and Plants under Domestication*.

LILY OF THE VALLEY: *J. B.* They are good strains, well grown.

NAMES OF PLANTS: *G. P.* 2, *Lonicera Ledebourii*; 3, *Ribes aureum*; 5, *Viburnum Awafurkii*; 7, *Daphne laureola*.—*H. J. C.* *Vicia sepium*, and *Specularia hybrida*.—*W. A. G.* 1, *Mackaya bella*; 2, *Thomasia quercifolia*.—*Wokingham*, two shoots of trees. 1, *Sorbus intermedia*; 2, *Pyrus aria*, variety.—*F. Carr.* *Saxifraga granulata*, double form.—*G. P.* *Philadelphus coronarius*.—*J. F.* 1 and 3, next week; 2, *Trifolium minus*; 4, *Hordeum murinum*.—*W. A.* *Oncidium carthagenense*. A *Dendrobium* of the *Aporum* section.—*G. J. D.* 1, *Oncidium maculatum*; 2, *Ceanothus azureus*.—*Old Subscriber.* *Gongora atropurpurea*.—*G. T. S.* 1, please send again; 2, *Prunus padus*.

PEACHES, *J. P.*, and GRAPES, *W. P.* Your trees and Vines and fruits are affected with mildew. Syringe with 4 oz. of soft soap dissolved in a gallon of water. Smear the pipes with sulphur and lime, or clay, in the form of a paint, warming the pipes afterwards; or better still syringe with sulphide of potassium at the rate of ½ oz. to the gallon—this is a good remedy for mildew on any plant—it should be washed off ten minutes afterwards. Maintain a warm buoyant state of the air in the houses, and do not be very free with the use of the watering-pot, especially in the afternoon. Avoid cold air entering the lower part of the house, excepting it is warm outside; do not let the borders wait for water.

ROSE GRUDES: *J. M. S.* Syringe with soapy water frequently if you have not time to handpick the bushes.

STRAWBERRIES: *W. J. P.* Strawberries will pay better than Cucumbers if, for the latter, you can get only 4s. 6d. per doz., the cultivation being overdone, in so far as regards the Southern markets. Keen's Seedling is a favourite variety, but it travels badly, and is better adapted for consumption at home. Sir C. Napier, Marguerite, La Grosse Sucrée, Comtesse H. de Thury, and the Elton—which you have, and which is good for a later supply—are the best. The main points are good appearance and size, with firm flesh. Twelve average fruits may weigh between 5 and 6 oz.

TOMATOS DISEASED: *C. L., Kirkintilloch, N.B.* The disease of your Tomatos is the "black spot." You will find it fully described and illustrated in the *Gardeners' Chronicle* for November 12, 1881, p. 621. Tomatos in the condition of the examples sent cannot of course be cured; but by cutting off and destroying the diseased individuals you may possibly prevent the disease from spreading.

VARIEGATED HORSE CHESTNUT FOLIAGE, &c.: *W. H. B.* See the article on this subject in our issue for May 26.

VINE LEAF: *S. S.* Looks like scalding, but you give no particulars of culture.

WYCH OAK: *C. Y. M.* We know of no Oak with that denomination; perhaps Wych Elm is the tree meant.

*. Orchid bloom in great variety, but the demand not very good.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended June 9:—Wheat, 31s. 8d.; Barley, 24s. 8d.; Oats, 16s. 7d. For the corresponding week in 1887: Wheat, 35s. 4d.; Barley, 23s. 1d.; Oats, 17s.

“ARCHIMEDEAN” AMERICAN LAWN MOWERS.

AWARDED HIGHEST PRIZE AT THE Paris Exhibition, 1878; and the JURY, in their REPORT say:—“The ‘ARCHIMEDEAN’ did the BEST WORK of any Lawn Mower exhibited.” ALSO AT Sydney Exhibition, 1879-80 AND AT Melbourne Exhibition, '80-1

Opinions of the Press:—“Far superior to any of ours.”—Vide The Field. “Remarkably easy to work.”—Vide Gardeners' Magazine. “The quickest, most simple, and most efficient mower ever used.”—Vide Gardeners' Chronicle. “We feel bound to recommend it to our readers as one of the best mowers we have as yet made acquaintance with.”—Vide Floral World.

PRICES FROM 25s.

Delivered Carriage Free to all Railway Stations in Great Britain.

WILLIAMS & CO. (Limited), Manufacturers and Patentees.

SELLING AGENTS: J. G. ROLLINS & CO. (LIMITED), AMERICAN MERCHANTS, OLD SWAN WHARF, LONDON, E.C.

BEESON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 13s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

“We have used STANDEN'S MANURE for some years, and have never found any fertilizer so safe and valuable. Its action is literally ‘magical.’ We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887.”

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 58 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CORRY, SOPER, FOWLER & CO. (LIMITED), FINSBURY STREET, LONDON, E.C.

CLAY'S FERTILISER OR PLANT FOOD

POPULAR GARDENING BOOKS.

By far the most widely read on the subject, full of soundest and best information, Mr. Ryder's writings have been praised by every Gardening Paper. The books are practical, interesting, reliable, and please all readers.

How to Grow Roses in the Garden and in Pots under glass. Chapters on Budding, Grafting, &c., &c. Post-free, 7d.

How to Grow Tuberous Begonias. Chapters on Raising Seed and every other part of culture. A new and thoroughly revised edition. Post-free, 7d.

Every Amateur and every Gardener as well should read these books. Only to be obtained from

RYDER AND SON, Seed Merchants, Sale, Manchester.

Estate Sales.
The best County medium for Advertising Sales of Estates is

THE WORCESTER HERALD, the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution, plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the *Worcester Herald*. Specimen copies sent free. Published Friday for Saturday, price 2d.
Offices, 72, High Street, Worcester.

Sales of Stock and Agricultural Effects.

THE WORCESTER HERALD is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcestershire. Specimen copies free. Published Friday for Saturday, price 2d.
Offices, 72, High Street, Worcester.

Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms to Let, would do well to Advertise in

THE WORCESTER HERALD, the Largest and Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large Circulation, moderate charge. Specimen free. Price 2d. Published Friday for Saturday.
Offices, 72, High Street, Worcester.

GARDENING APPOINTMENT.

MR. W. H. LEWIS, late Gardener to Captain AYLMER, Corsley House, Warminster, has been appointed Head Gardener to B. J. D. WYKEHAM, Esq., Tythrop House, Thame, Oxford.

TO CAPITALISTS.

A NURSERYMAN, with an OLD-ESTABLISHED FIRST-CLASS BUSINESS, IS IN WANT OF £3000 to £5000, to further Develop a Largely Increasing Business.—Address, in first instance, Box 32, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

WANTED, a PARTNER (Practical), with Capital, for Nursery Business in Midlothian.—No. 187, KEITH AND CO., Advertising Agents, Edinburgh.

WANTED, a MANAGER, who understands the Cultivation of Palms and Decorative Plants. One who could introduce a Furnishing Connection would be liberally treated with.—State full particulars (in confidence). PALMERIA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD GARDENER. Total abstainer of long standing. Married, no children. Wife to look after house. First-rate in all branches of Gardening. Excellent references as to character.—Apply, 9 to 10 A.M., 32, Elm Gardens, Chelsea, S.W.

WANTED, a HEAD WORKING GARDENER, where five men are kept. Must have a thorough knowledge of all branches.—Apply by letter in first instance, to W., South Villa, Regent's Park, London, N.W.

WANTED, a thoroughly good SINGLE-HANDED GARDENER, and who understands Stock.—State age, particulars of former situations, number in family, and wages expected to O.S., 43a, Deacon's Advertising Offices, Lendenhall Street, E.C.

WANTED, an UNDER GARDENER, to work under Glass. State wages.—E. HARTLAND, Chepstow.

Nursery Foreman Wanted.

WANTED, an industrious and steady Man as NURSERY FOREMAN. He must possess a general knowledge of Nursery Stock and must be an expert and successful Budder and Grower of Fruit Trees, and occasionally to act as Salesman. Liberal wages offered to a suitable man.—Apply, stating where last or at present employed, with age, to JNO. JEFFERIES and SON, Royal Nurseries, Cirencester.

WANTED, a First-class FOREMAN, for the Glass. Twelve hands, three for Glass. Wages 19s. with rise. Comfortable bothy, milk, vegetables, &c. Copies of testimonials only.—GARDENER, Windlestone, Ferry Hill, Durham.

Forest Tree Foreman.

WANTED, IMMEDIATELY, a thoroughly practical and efficient steady, reliable, and obliging MAN.—Apply, stating experience, and where gained, age, salary expected, &c., to Messrs. DICKSONS, Chester.

WANTED, a young MAN, in Orchard Department.—Apply, personally or by letter, to SHUTTLEWORTH, CARTER AND CO., 191, Park Road, Clapham, S.W.

WANTED, good GRAPE THINNERS.—Apply by letter to EDWARD BENNETT, The Vineyard, Potter's Bar, N.

Seed Trade.

WANTED, a TRAVELLER for Northern Journey, and to fill in time at Counter.—State age, experience, and salary required, to H. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a trustworthy YOUTH, to Assist in the Seed Shop. One who has a knowledge of Plants and the Cut Flower Trade preferred.—Apply, in own handwriting, stating age, wages required, and experience, to J. WRIGHT, 49, Grauby Street, Leicester.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

WANTED, A GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD and SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter; Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.—JOHN DOWNIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engage-ments. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Eliot, Yorke Hamble Cliff, Southampton, can with confidence recommend his Foreman, G. Dovey, as above.

GARDENER (HEAD).—Age 31; five and a half years Head Gardener to the late Sir Alfred Ryder. Excellent character and testimonials. Abstainer.—C. HIGGINS, Wellswood, Torquay.

GARDENER (HEAD), or where help is given.—Experienced in Stove and Greenhouse Plants, Flower and Kitchen Garden. Good character.—J. D., 18, Elthorne Road, Upper Holloway, N.

GARDENER (HEAD).—£5 will be paid by Advertiser to any person enabling him to get a good situation as above. First-class abilities and character.—G. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Married, no family; practical knowledge of his profession in all branches. Highest character.—JAMES HILLING, Brown Candover, Aylesford, Hauts.

GARDENER (HEAD).—Age 30; single at present fifteen years' experience in all branches. Highly recommended by his present employer, with eight years' good character as Foreman.—W. FISHER, 6, South Cottages, York Road, Weybridge.

GARDENER (HEAD), where two or more are kept.—Married, no family; thoroughly experienced in Stove and Greenhouse Plants, Flower and Kitchen Gardens. Wife an excellent Laundress.—G. C., Howard's Printing Office, Sydenham, S.E.

GARDENER (HEAD WORKING).—Age 38, married, no family; thoroughly understands his duties. Six years in present place; five-and-a-half years previous.—H. M., Binfield House, Byfleet, Weybridge, Surrey.

GARDENER (HEAD WORKING), where two or three are kept.—Age 29; thorough knowledge of Gardening in all its branches. Fifteen years' experience, four years in last place. Undeniable testimonials as to character and ability.—WM. MOORE, 24, Prospect Terrace, Hunslet Moor, Leeds.

GARDENER (HEAD WORKING); age 46, married, no incumbence.—A GENTLEMAN can highly recommend his late Gardener to any Lady or Gentleman requiring a thorough practical man in every department of Gardening. Five years' excellent character and eight previous.—J. HATCH, 57, Donnington Gardens, Redlands, Reading.

GARDENER (HEAD), or FOREMAN.—Age 35, married; thoroughly practical in all branches. Early and Late Forcing. Twenty years' excellent references.—J. A., Post Office, New Brickenham, Norfolk.

GARDENER (HEAD), or FOREMAN in a Nursery.—Age 39, married; well versed in detail in all branches of practical Gardening. Over nine years' character in present situation, and four years in Nursery Work.—Mr. HALL, South Villa, Inner Circle, Regent's Park, London, N.W.

GARDENER (HEAD), or good SINGLE-HANDED.—Married; thoroughly understands his duties. Seven and a half years' good character.—A. WALLACE, 2, Biggin Hill Cottages, Upper Norwood, S.E.

GARDENER (HEAD or SINGLE-HANDED).—Age 40; twenty-nine years' experience in all branches in the South and North of England. Twelve years' excellent reference.—G. WHITMAN, Lambton Street, Chester-le-Street, Durham.

GARDENER, where three or more are kept.—Twelve years' good practical experience in three large establishments. Highly recommended from all previous employers.—J. CLARK, 5, Leicester Road, Ashby-de-la-Zouch.

GARDENER (SINGLE-HANDED).—Married; willing to be generally useful. Understaada, Fruit, Flowers, Vegetables, Cucumbers, Melons, &c. Good character.—FINCH, Rusper, Horsham, Sussex.

GARDENER (SINGLE-HANDED), or under a Head.—Age 28, married when suited. No objection to Horse and Trap. Good reference.—R. DUDLEY, Walton, Epsom, Surrey.

GARDENER (SINGLE-HANDED), or as UNDER in a good establishment.—Age 24; two and a half years in present situation.—F. FARRANCE, The Hurst, Coldharbour, Tonbridge.

GARDENER (SECOND, or SINGLE-HANDED).—Age 22; seven years' experience Indoors and Out. Understands Orchids. Seven years in last place.—W. M. D., Park Cottage, Park Road, East Molesey, Surrey.

GARDENER (SECOND), in a good establishment.—Age 25; eleven years' good experience. Good reference from previous and present situations.—R. PAGE, Victoria Street, Ely, Cambridge.

GARDENER (SECOND), or otherwise.—Age 24, married; thorough good character. Nine years experience Inside and Out. Abstainer.—59, Castle Street, Hertford, Herts.

GARDENER (UNDER, SECOND).—Four years' experience.—State wages, and Premium required.—F. HARRIS, Cuddesdon Palace Gardens, Wheatley, Oxon.

GARDENER (UNDER).—Age 18; used to Glass and Kitchen Garden. Good references. Total abstainer.—A. C., 52, Bathurst Mews, Paddington, W.

GARDENER (UNDER), single, can produce good testimonials. Used to In and Outdoor Work.—Full particulars to H. F., 2, West St., Ewell, Epsom, Surrey.

GARDENER (UNDER), private place or Market Garden, where Fruit and Cut Flowers are grown.—Age 22; good character.—J. HOATH, Street Farm, Rotherfield, Sussex.

GARDENER (UNDER).—Age 19; strong and active. Three years' good practice. Premium not objected to. Total abstainer.—PLACIDUS, Cheverton Farm, Newport, Isle of Wight.

FOREMAN, in the Houses.—Eleven years' experience in all branches in good places. Good references from last and previous employers.—G. LILLEY, Thorney, near Peterborough, Cambs.

FOREMAN.—Age 29; used to Mansion Decoration and all branches of Gardening. Good references from last and previous employer. Filled two such places previously.—C. B., 18, Salisbury Street, Upper Holloway, N.

FOREMAN, in a good establishment.—Age 28; thirteen years' experience. Well versed in all branches. Two years in present situation.—G. HOLLISTER, Redfield, Winslow, Bucks.

FOREMAN, in the Houses; age 24; eleven years' experience.—Mr. OFFER will be pleased to recommend to any Gardener in want of the above Alfred Smith.—The Gardens, Handcross Park, Crawley, Sussex.

FOREMAN (WORKING) under Glass.—Age 33; nine years' in the trade. Good Salesman. Well up in all Floral Arrangements. Two years in present place with Mr. R. Crossling, Penarth Nurseries, South Wales, who will highly recommend.—J. K., Mrs. H. Keyte, Shirley Heath, Shirley, Birmingham.

To Nurserymen.

FOREMAN, or SALESMAN, Market or Nursery.—Age 30, married; well used to all kinds of Plants and Cut Flowers; thoroughly versed in Wreaths, Crosses, Bouquets, &c. Highest references.—E. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, with a good knowledge of Seeds.—Plants, and General Nursery Stock. Good character.—MENTHA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Seed Trade.

CLERK now wanting new engagement.—Can be highly recommended.—For particulars apply to G. Box 3, Post Office, Chester.

HOLLOWAY'S OINTMENT and PILLS.—Diseases of the Bowels.—A remedy which has been tested and proved in a thousand different ways, capable of eradicating poisonous taints from ulcers and healing them up, merits a trial of its capacity for extracting the internal corruptions from the bowels. On rubbing Holloway's Ointment repeatedly on the abdomen a rash appears, and as it thickens the alvine irritability subsides. Acting as a derivative, this Ointment draws to the surface, relaxes the tender intestines from all acid matters, and prevents inflammation, dysentery, and piles, for which blistering was the old-fashioned though successful treatment, now from its painless fallen into disuse, the discovery of this Ointment having proclaimed a remedy possessing, equally derivative, yet perfectly painless powers.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

SALES BY AUCTION.

Monday Next.

SPECIAL SALE OF ORCHIDS IN FLOWER. MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY NEXT, June 25, at half-past 12 o'clock precisely, a large assortment of ORCHIDS in FLOWER, amongst which will be found numerous varieties of Odontoglossums, Dendrobiums, Cattleyas, Cypripediums, Masdevallias, Oncidium, a very strong plant of Odontoglossum Edwardii, Trichopilia suavis alba, and many others.

On view morning of Sale, and Catalogues had.

Tuesday and Wednesday Next, June 26 and 27.

IMPORTANT UNRESERVED SALE of the whole of the well-known COLLECTION of ESTABLISHED ORCHIDS formed by F. A. Philbrick, Esq., Q.C., who is relinquishing the cultivation of Orchids.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY NEXT, June 26 and 27, at half-past 12 o'clock precisely, without reserve, the whole of this well-known COLLECTION of ESTABLISHED ORCHIDS. The plants are in unusually fine condition, and the collection includes probably the grandest lot of Phalaenopsis offered for many years, beside a large number of specimens of hybrid and other Cypripediums. Among the principal items the following may be mentioned:—

- Phalaenopsis amabilis, including picta and many other fine varieties
Dayana (true)
grandiflora, the best Java and Borneo varieties
Schilleriana, including magnifica and other grand forms
casta, three healthy plants
leucorhoda, fine variety
speciosissima
tetraspis
violacea Schroderi
Marie and others
Cypripedium Morganian
Birtete
Leucum superbum
Ceanothum superbum
Williamsi
vexillarium
Sedum superbum
barbatum grandiflorum superbum (Henderson's)
polinum
selligerum majus
grande
Schroderi
narrowophyllum
Sperganium magnificum
Vetchi
Lowi superbum
Chaunium
punctatum violaceum
Lelia anceps Dawsoniana, with 5 bracts
Hilli Percevalliana
Schroderi virginiana, and other white varieties
lilacina
elegans, many fine forms
Saccolabium bellinum
Cymbidium Philbrickianum

Also Bateman's "Orchidaceae of Mexico and Guatemala," elephant folio, 1843, Sir Pitt Rivers' copy; Williams' "Orchid Album," both series, in 6 volumes, half-bound in morocco, gilt. Bateman's "First and Second Century of Orchidaceous Plants," and Bateman's "Monograph of Odontoglossum."

Messrs. P. & M. desire to state that no plants will be sold privately prior to the Sale.

May be viewed on the premises by cards obtainable of the Auctioneers, or at the Sale Rooms on the morning of Sale. Catalogues may be had of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Friday Next.—Imported Orchids.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, June 29, at half-past 12 o'clock precisely, ODONTOGLOSSUM CITROSUM, in large masses; O. NEBULOSUM, large masses; CATTLEYA BOWRINGIANA, large masses; EPIDENDRUM MACROCHILUM ALBUM, described by the collector as the finest varieties ever offered; CATTLEYA MOSSIE, CYMBIDIUM EBURNEUM, CYPRIPEDIUM STONEI, C. VENUSTUM PARDIUM, ONCIDIUM CESTRUM, selected masses; O. CUCULLATUM, O. PULCHELLUM, ODONTOGLOSSUM CERVANTESI, ARUNDINARIA, possibly new; ODONTOGLOSSUM HALLII NANTOGLOSSUM, SACCOLABIUM GUTATUM, &c.

On view morning of Sale, and Catalogues had.

Sydenham.

CLEARANCE SALE OF STOVE and GREENHOUSE PLANTS, by order of Thos. Christy, Esq., who is leaving the Residence.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, on the Premises, Malvern House, Sydenham, on WEDNESDAY July 4, at 12 o'clock precisely, without reserve, a large quantity of STOVE and GREENHOUSE PLANTS, AZALEAS, DECORATIVE PLANTS, ORCHIDS, &c.

Fuller particulars will appear next week. Catalogues may be had, when ready, of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Friday, July 6.—Preliminary Notice. ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM. CATTLEYA SANDERIANA.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. G. T. White to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, July 6, without reserve a magnificent importation of ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM, described by Professor Reichenbach, and also a grand importation of CATTLEYA SANDERIANA, with dormant eyes. The entire importations will be offered. Further particulars will appear next week.

The Downside Collection of Orchids. PRELIMINARY NOTICE.

HIGHLY IMPORTANT EIGHT DAYS' SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of

ESTABLISHED ORCHIDS.

that has ever been submitted to Public Competition.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Wm. Lee, Esq. (who is Selling the Estate of Downside, and relinquishing the cultivation of Orchids), to SELL BY AUCTION, on the Premises, Downside, Leatherhead, about 1 mile from either of the Leatherhead Railway Stations,

On TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 10, 11, 12, and 13, 1888;

and also on

TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 24, 25, 26, and 27, 1888.

at half-past 12 o'clock precisely each day, the whole of this most valuable Collection of

ESTABLISHED ORCHIDS.

A List of the principal plants appeared in the Gardeners' Chronicle on June 9th last.

Messrs. P. & M. desire to mention that no plants will be sold privately, but that the whole will be submitted to public competition.

The collection may be viewed any day prior to the Sale, by cards to be obtained of Messrs. PROTHEROE AND MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C.

The Catalogue is in hand and will shortly be published. Copies can be obtained on application to the Auctioneers.

Havant.

FIRST ANNUAL SUMMER SALE.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Ewing & Co. to SELL BY AUCTION, on the Premises, the Sea View Nurseries, Havant, on WEDNESDAY, July 11, at 12 o'clock precisely, 5000 TEA, NOISEFFE, and other BOSES in pots; 2000 IVIES of the choicest green leaved and variegated kinds, 1000 AMPELOPSIS VEITCHII, and other VIRGINIA CREEPERS; a large quantity of Hardy PASSION FLOWERS, including the new White Constance Elliott; Japanese and other HARDY EVERGREENS, choice flowering and foliaged TREES and SHRUBS, Hardy CLIMBING PLANTS, &c., all in pots suitable for immediate removal.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises, at the principal Hotels in the district, and of the Auctioneers, 67 and 68, Cheapside, E.C., and Leytonstone.

Thursday Next.—(Sale No. 7700)

ADIANTUM WALTONII (New Hybrid).—This handsome Maidenhair Fern is now being sent out. For full description, by the late T. Moore, see Gardeners' Chronicle for January 29, 1887, under Adiantum (New, Deanda ed.). The above Fern produces fronds in great abundance, and forms an extremely graceful appearance, making a handsome plant for exhibition purposes. The great length of its frond and the length of the side pinnae make it doubly useful as a Fern for cutting purposes, the pinnae alone being quite as useful as medium-sized fronds of the well-known A. canalicatum.

Good strong plants, with five to seven fronds, 2s. 6d. each; six for 12s. 6d. Smaller plants, 1s. 6d. each; six for 7s. 6d.; package included.

EXORS. of HENRY WALTON, Edge End Nursery, Brierfield, Burnley, Lancashire.

BEDDING PLANTS.—Vesuvius, H. Jacoby, & Co., 15, 67, per dozen; Calceolarias, 1s. 3d. per dozen; 10,000 Lobelias, from cuttings, large plants, 7s. 6d. per 100, all out of pots; 5000 scarlet Geraniums, out of boxes, strong plants, 7s. 6d. per 100, large reductions by the 1000; Mesembryanthemum, 6s. per 100, 50s. per 1000; Pyrethrums, Stocks, Asters, Zinnias, Sunflowers (tall and dwarf), Wallflowers, Tropaeolums, &c. AUGUSTUS MOORE, St. John's, Spalding.

B. S. WILLIAMS' NEW PLANTS FOR 1888, ARE NOW READY FOR DISTRIBUTION.

"Gather Honey from Your Flowers." NEIGHBOUR'S CELEBRATED BEE-HIVES

For taking Honey without the Destruction of the Bees.

Philadelpia Exhibition, 1876. Paris Exhibition, 1878.

Three Silver Medals and several others awarded to GEO. NEIGHBOUR & SONS FOR THEIR IMPROVED

COTTAGE BEEHIVE,

as originally introduced by them, working three bell-glasses or tray of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.

Price, complete, £1 15 0

THE BUNCFIELD HIVE.

As will be seen by reference to the above engraving, this is very similar to other Frame Hives, except that the walls are made of straw, neatly bound with cane. Price, 15s.

CATALOGUE OF IMPROVED HIVES AND APPLIANCES.

with Drawings and Prices. GEO. NEIGHBOUR & SONS, 127, High Holborn, W.C. (corner of Southampton Street), and 149, Regent Street, W. Established 1815.

GARDEN REQUISITES.—Sticks, Labels, Virgin Cork, Raffia, Mats, Bamboo Canes, Rustic Work, Mauners, &c. Cheapest Prices of WATSON AND SCULL, 90, Lower Thames Street, London, E.C.

THE TROPICAL AGRICULTURIST, A MONTHLY RECORD OF INFORMATION FOR PLANTERS

Of Tea, Cocoa, Cinchona, Coffee, Indiarubber, Sugar, Palms, Cotton, Cardamoms, Kola, Caca, Cinamon, Nutmegs, Fibrous Plants, and other Products suited for Cultivation in the Tropics.

Published at Observer Office, Colombo, Ceylon, on or about the 1st of each month. Commenced in June, 1881.

THE "TROPICAL AGRICULTURIST" has now an assured position in its large circulation in Ceylon, Southern and even Central and Northern India, the Straits Settlements, Samatra, Java, Borneo, Northern Australia, Queensland, Central America, Natal, Mauritius, and the West Indies. From all sub-tropical planting settlements we have had cordial approval of the publication and an encouraging measure of support. The English, Indian, and Colonial Press have spoken in commendatory terms of the T. A., as also Directors of Public Gardens from Sir Joseph Hooker, F.R.S., downwards, and so have all Planters.

No Planter should be without it. Rates of Subscription, including Postage, in advance: £1 sterling, Rupees 12, Dollars 5.

Single Copies, 2s., or R1; Back Copies, 3s., or R1.50. Any one of the Four Volumes completed (1881-2, 1882-3, 1883-4, 1884-5), bound in cloth, lettered, with Comprehensive Index, for £1 10s. (or R18), carriage prepaid.

THE TROPICAL AGRICULTURIST.

As a medium for English, American, and Australian ADVERTISEMENTS of goods suitable for the tropics, India as well as Ceylon, the Straits Settlements, Java, and West Indies (Central America being included in that term), or connected with agriculture, the Tropical Agriculturist stands unrivalled, the work being constantly in the hands of Native as well as European and American Agriculturists. Being a Monthly Periodical the Tropical Agriculturist lies on the table and is very often referred to during each month—a fact which Advertisers will know how to appreciate.

Mr. W. T. THISELTON DYER, F.L.S., C.M.G., Director of Kew Gardens, writing of the T. A., refers to it as "an astonishing repository of everything relating to the Economic Botany of the East."

For the Sale of Plants, Seeds, Machinery, Implements, &c., used in Tropical (Tea, Sugar, Fibres, &c.) Agriculture, no better Advertising Medium exists.

Rates for Advertisements:—

[Nine words to a line.] Twelve Lines and under, per Line ... 9d. (8 annas) About Twelve Lines ... 8d. (7 annas) Quarter Page (once) ... 17s. R10 5 per Cent. off Half ... £1 8s. R17 for each additional Whole ... £2 8s. R24 insertion

For long contracts special reductions. Communications respecting Advertisements and Subscriptions for the "TROPICAL AGRICULTURIST" may be addressed to A. M. AND J. FERGUSON, Colombo.

J. H. AND CO., 3, Houverie Street, London, E.C. G. STREET AND CO., 30, Cornhill, London, E.C. Or Agents in all parts of the World.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

PINK, very choicest, mixed. Some single forms will be found included in this choice strain, and they are very beautiful. Per packet, 1s.

.. Mrs. SINKINS, selected from a lovely non-splitting form of this well-known plant, and own saving, 1s. and 2s. 6d.

* * * Hartland's Mixed Packets of Gloxinia, Primula, Cineraria, and Calceolaria, are unequalled for quality, 1s. 6d. and 2s. 6d. each.

W. BAYLOR HARTLAND, F.R.H.S., Seedsman, 24, Patrick Street, Cork

NEW PELARGONIUM, "DUCHESS OF TECK."

Awarded a First-class Certificate at the Manchester Royal Botanical and Horticultural Society's Summer Exhibition of 1887. It is a white Regal decorative variety, semi-double, immense trusses, the flowers are erect, petals undulated; distinguishing it from the ordinary Pelargoniums. It is novel and conspicuous; has a compact habit, and is one of the best Pelargoniums in cultivation. It is invaluable for cut flowers where white is in demand.

3s. 6d. each, 30s. for 12 plants, 50s. for 25 plants. Cut Flowers sent on application. Sent out by FISHER, SON, AND SIBRAY, Handsworth Nurseries, Sheffield.

ORCHIDS

IS NOW IN FULL BLOOM, AND ON VIEW DAILY.

The magnificent collection of **STOVE and GREENHOUSE FLOWERING and FOLIAGE PLANTS, TREE and other FERNS, PALMS, CYCADS, CAMELLIAS, AZALEAS, AMARYLLIS, GREENHOUSE RHODODENDRONS, &c.**, is perhaps the largest in Europe.

Amateurs and others who take an interest in this class of Plants would do well to pay these Nurseries a visit.

CHOICE AND USEFUL PLANTS

AT REASONABLE PRICES. Per doz. plants.
ASPARAGUS tenuissimus, the new Asparagus Fern, 12s. & 18s.
CANNAS, named, choice sorts 9s. & 12s.
.. useful ornamental sorts 1s. & 4s.
CALADIUMS, in growth, our selection ... 9s., 12s. & 18s.
CARNATIONS, for border, best named ... 9s. & 12s.
.. tree, small 6s. & 9s.
.. flowering plants 18s., 24s. & 30s.
CHRYSANTHEMUMS 3s. & 6s.
BEGONIAS, single, white, pink and scarlet bloom- ing plants 6s. & 9s.
.. fine double 24s. & 30s.
CACTUS DAHLIAS, in six varieties 6s.
TOMATOS, in four varieties, strong plants ... 1s. & 6s.

ORCHIDS.

12 beautiful varieties, selected for warm or coolhouse 21s. & 42s. 100 healthy and established plants, in fifty good varieties, £10

Amateurs may place perfect confidence in these selections.
HOOPER & CO. Limited, PINE-APPLE NURSERY, MAIDA VALE, and COVENT GARDEN, W.C.

FERNS A SPECIALTY.

The largest, most complete, and profusely **ILLUSTRATED CATALOGUE OF FERNS** ever published, containing over 120 Illustrations, and much valuable practical information on the cultivation of Ferns, &c. 1s. 6d. post-free. Smaller Catalogue of over 1300 species and varieties free on application.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

TEA AND NOISSETTE ROSES,
OF BEST SORTS ONLY.

Now ready, fine plants in 5-inch pots, 1s. 6d. each, 12s. per dozen, 80s. per 100. On prepaid orders packing not charged; and if of 20s. and upwards prepaid Carriage free to any Station on the Brighton and South Coast or South-Western Railways; and if of 60s. and upwards and prepaid, Carriage free to any Railway Station in England and Wales.

Prices of New Varieties quoted on application.
EWING AND CO., Sea View Nurseries, Havant, Hampshire.

TEA ROSES.

GARAWAY CO. offer 12 of the above, best named sorts, including **MARECHAL NIEL** and **NIPHETOS**, in 5-inch pots, for 10s. cash.

GARAWAY CO.,
Durdham Down, Clifton, Bristol.

Now ready, in cloth, 11s. 6d.
THE GARDENERS' CHRONICLE,

ROSE PROSPECTS.

WHEN we get within a fortnight or three weeks of the commencement of the Rose season, prophesying as to its character becomes a much easier thing than when the attempt is made some six or seven weeks previously; for, although we are never sure, in our changeable climate, of what the weather may be, or how it may affect the bloom of our Roses, yet it is not very likely that we shall have such very decided changes as to reverse the present condition of things. We may, indeed, get one of those bursts of hot weather which upset all calculations, drive Roses into flower prematurely, scorch and wither up the darker-coloured flowers, and make things generally unpleasant. We have had such for some years in the first week in July, making shows unpleasant, and upsetting many a well-planned scheme. Or we may have cold weather, which will retard our blooms—but we hope not; and in that hope let us see what at the present time are our prospects.

We have for so many years had what we are fain to call abnormal seasons that it is a comfort to look hopefully at one which we hope does not deserve that name. We have not had those destructive frosts which in May—from the 20th to the 26th—have done so much damage and blasted the hopes of many an aspiring exhibitor, when the tender shoots have been cut back, and a fresh start has had to be made. From some growers I have heard that they were badly hit by a frost on May 10; and, indeed, the variability of our climate makes it very difficult to say anything of one's neighbour's experiences. Thus, on June 14 we had a gentle rain, while two miles off there was a heavy hailstorm—so heavy that the boys were able to make snowballs. Now were one to ask a Rose grower there about the season, he would have a very dismal account to

render; but taking the accounts which I receive and the observations I have been able personally to make, I think we may see that the prospects are so far good.

With regard to the enemies with which we have to contend, I may say that the bud-maggot seems to be unusually abundant this year; it is not so much so with me, but I hear of it on all sides. This will be a hindrance to many, but it is one of those enemies that can be grappled with, and, as I said recently, there is but one way to get rid of it. Of aphides I have seen no trace as yet, and I think that, generally speaking, our Rose gardens are tolerably free from them. It is very difficult to say what weather is most conducive to their increase, but I should think that the comparatively low temperature we are now experiencing cannot be so; but here again we may see suddenly an influx of the unwelcome visitor; as yet, however, he has not arrived. Of red-rust or orange fungus I have heard many complaints; it is a insidious enemy, and although it may not do permanent injury to the bushes, yet it is very disfiguring to the foliage, and when it comes so early must be destructive to the size and substance of the flowers.

The exhibition season will commence in about a fortnight's time, and already exhibitors are preparing for the fray; on all sides one hears the sound of preparations, and those who have been watching and caring for their pets during the past year are now looking for the result. There can be but little doubt that the show of the National Rose Society, to be held at the Crystal Palace on July 7, will be about the right time, and that it promises to be the grandest show of Roses ever held. The Society has never been niggard in the prizes it has offered, but this year it has gone considerably beyond its previous efforts. There is offered, besides pieces of plate, more than £300 in prizes, and although it may be the fashion with some to sneer about this "paltry pelt," a good prize list is sure to bring exhibitors. Growers for sale naturally expect to get something towards their expenses, while there are many amateurs who would never be able to compete if they had not some expectation of meeting, at any rate, part of their expenses. Many gentlemen give their gardeners the amount of prize-money; and there can hardly be one exhibitor who expects to "make" anything by his prizes. The eagerness with which the Society's medals are sought by amateurs testifies to the strong feeling of ambition that characterises most of our amateurs. There are additions made to our host of exhibitors every year, and while changes take place there seems to be no diminution of interest, and I am inclined to think that there will be a larger number of exhibitors than the Society ever had before.

One thing always enhances the interest of Rose shows—especially of the National—viz., the hope of seeing some new flowers, and I should think that they will be abundantly gratified this year. We do not expect to see much of the Roses sent out by the French growers last autumn—we have already noted as many of them as we are likely to see at present; and in Sappho, Madame Hoste, and Gloire de Margottin we have had promises of something good by-and-bye; but it would be idle to expect anything from them now. They are received in October by our English nurserymen, as grafted plants most probably. When received they are potted, put into heat, and from that time are forced forward at a tremendous rate. Buds are used as soon as possible for grafts; when these take and begin to grow they are in turn used, so that from a couple of plants hundreds, if not thousands, are ready for sale; but it is perfectly clear that it would be impossible to expect anything like a good bloom from these plants. Sometimes, indeed, a grower will spare one of his imported plants and will not put it through this forcing process, and so be able to exhibit a bloom or two at the spring metropolitan shows; but when we look over the stands of new Roses in July we generally find that the bulk of them consists of Roses which have been out for a couple of years, with just a sprinkle of miserable

blooms of the really new ones, often conveying a very inadequate idea of what they really are, but there are some of the Roses which have nominally been out for a couple of years, of which we want to see more: we want to see Her Majesty and Grand Mogul, and those three Irish novelties—Earl Dufferin, Lady Helen Stewart, and Miss Helen Brownlow, and others of which our Rose growers have spoken well—Madame Joseph Desbois, &c.; we want, too, to see Lady Alice and Mrs. John Laing, and the Puritan; and then we hope Messrs. Mack & Son will let us see Sir Rowland Hill and Duchess of Leeds—the former especially. There are perhaps other novelties waiting: one I have seen, Caroline D'arden, but not in a condition to enable me to form an accurate judgment. It was sent to me from Ireland by Messrs. Dickson & Sons of Newtonards, the raisers of Earl Dufferin. It came by post, and the authorities had not dealt very tenderly with it, but it realised in one point the poet's words:—

"You may break and may ruin the vase if you will,
But the scent of the Rose will cling to it still!"—

for it was most deliciously sweet-scented, a quality in which I am sorry to say some of our modern Roses are utterly deficient, although every one expects to find it in the Rose.

Our hopes are large, our prospects bright, and let us earnestly hope that this season at least will redeem the character which has been given to so many of recent years—abnormal. *Wild-Rose*.

NEW OR NOTEWORTHY PLANTS.

LÆLIA × HORNIANA, n. *hy.* (*Vindob.*)

A HYBRID between *Lælia purpurata* and *L. elegans*, the latter being the pollen parent—a cross effected by Mr. Ferdinand Horn, the Orchid grower of Baron Nathaniel von Rothschild, Hohewarte, near Vienna. The bulbs are said to be nearly like those of *Lælia purpurata*, but broader, more flat, and shorter. The flower is of very strong substance, white, sepals and narrow petals lanceolate, acute. Lip most distinctly trilobed, side-lobes obtuseangled, mid-lobe protruded, retuse. The basilar part is yellow, and there are some purple lines on the centre of the disc. The lateral lobes and the central lobe have a fine mauve tint over the good purple, and a thin white border, whilst the centre of the anterior lobe has a projecting white space as in *Lælia purpurata* pretexta. It is a lovely thing, and is dedicated to its enthusiastic cultivator, *H. G. Rehb. f.*

EPIDENORUM O'BRIENIANUM ×, n. *hy.*

Another genus must now be added to the number of those in which artificial hybrids have been obtained, and to Mr. Seden once more belongs the merit of producing another decidedly meritorious garden plant. It was obtained by crossing *E. evectum* with the pollen of *E. radicans*, better known in gardens at present as *E. rhizophorum*, and as would naturally be expected it is tolerably intermediate in character between its two parents. In habit it much resembles *E. radicans*, as it bears roots along the pseudobulbs like that species—a character not seen in *E. evectum*. The flowers of each are represented in the annexed engraving (fig. 103), which will show how the characters of the parents are represented in the hybrid. The segments are longer than in *E. evectum* but have the same general shape, while in *E. radicans* they are less narrowed at the base. The column is almost as straight as in *E. evectum*, while in *E. radicans* they are less narrowed at the base. The column is almost as straight as in *E. evectum*, while in *E. radicans* this organ is much curved, bringing the lip down to the lateral sepals. The shape and cutting of the lobes of the lip will also be noticed as much like those of *E. evectum*, while in the other species the side lobes are much larger than the front one, the margin less deeply toothed, and the whole lip very flat. Finally the coloration is very interesting. In *E. evectum* the whole flower is of a clear purple while in *E. radicans* the segments are orange-scarlet,

the apex of the column and centre of the lip deep yellow, the latter organ shading off to orange on the margin of the lobes. In the hybrid the colour is a uniform brilliant carmine, with a trace of the orange shade, the only exception being that the pair of crests on the lip are bright yellow, as in *E. radicans*. The combination of characters is extremely interesting—those of the mother plant on the whole preponderating in the flower, yet the presence of roots on the pseudobulbs show a stronger approach to that of the pollen parent in habit. The plant was exhibited by Messrs. Veitch & Sons at a recent meeting of the Royal Horticultural Society; also at the Linnean Centenary on May 25 last; and as flowers of the parent species were also exhibited for comparison, the group attracted a considerable amount of attention. It is a decidedly handsome novelty, its one drawback as a garden plant being that, like its parent species, it is a somewhat tall grower. *R. A. Rolfe*.

HARDY ROCK PLANTS AT KEW.

I SEND you a few notes made during a short visit to Kew on Monday, June 4, which may possibly be of use to some of your readers, and more especially to those with whom a herbaceous garden is in favour. I intend, however, the qualifying term herbaceous to have in this instance a more extended definition than is ordinarily bestowed upon it within the hallowed acre set apart for this purpose at Kew; and the lover of flowers must be hard indeed to please if at this time of the year he cannot derive matter for profitable investigation.

A glance round it is sufficient to show us that the order of plants just now in its greatest perfection is that known as Saxifragaceæ. So many and so varied are its types now in flower that it is at first difficult to single out any for "special mention." One, however, belonging to this group I do not hesitate in commending; this, from its distinction in colour and shape from the other members of this order, is certainly quite unique: I refer to *Saxifraga Burseriana*, in colour a bright yellow, with pendulous top-shaped bells, closed at the mouth, not unlike a large *Comfrey*, or, better still perhaps, resembling an *Abutilon*, though much smaller than the latter. One or two others of the usual family type are worth knowing and growing, especially *Saxifraga Hostii*, labelled from the European Alps.

Close by this order the Caryophyllaceæ display just now some of its members in rare perfection. *Arenaria grandiflora*, also *lanceifolia*, both of low growth, have closely packed masses of white starry petals; *Sagina glabra*, from France, belonging to same order, and *Arenaria juncifolia*, together with several varieties of *Lychnis*, show sufficiently the present possibilities of this group. Out-of-doors just now the order *Fumariaceæ* has some very pretty representatives of low growth and packed habit, and suitable for rockery work; particularly I would mention *Corydalis capnoides*, with varieties both white and yellow, from South Europe, and *C. lutea*, which I think we may call a native.

Although June is with us, I am glad to say that there are two species of *Anemone* in bloom, that bid fair when better known to form a connecting link between the more early flowered representatives from South France and Italy, and the beautiful *japonica*, which befriends us later in the year, and which will allow this favoured genus to be with us from May to November. I refer to *Anemone polyantha*, from the Himalaya. It has leaves like a *Caltha*, covered with short cottony down, and flowers not unlike those of a *Strawberry*. The still more exquisite *Anemone sylvestris*, labelled "Europe," should assort with the previous named species. The latter much resembles in flower *A. japonica* and has foliage like the common *Buttercup*. This specimen also figures to great advantage in the rockery adjoining. Among the Leguminous plants there are a few in flower just now that would certainly find a place in many gardens were they better known. I would mention in particular *Thermopsis*

fabacea, which I do not remember having met with in any private garden of my acquaintance; a native of North America, from which we obtain so many of our Leguminosæ, it resembles in size and shape a Lupin; the yellow spikes, however, are flat-headed, or abrupt, and do not taper as in that species; *Lathyrus Jordani*, from Italy; *Anthyllis montana*, possessing small pinkish-white round-headed trusses or umbels, is also well worth propagating, and is of a low habit of growth.

Genista pilosa forms just now a beautiful ornament for the rockery, being a low-growing yellow Broom of from 1 to 2 feet in height. Many of the Ranunculaceæ are just now coming into perfection. *Trollius napelliformis* is a very fine variety; *Thalictrum aquilegifolium*, of a pale pink, reminds one of the Hemp Agrimony, a wild chalk-loving plant not yet in flower.

Aquilegias of all shades, from deep blue to pure white; scarlet *Delphiniums* and *Pæonies* of the same order, just now should be adding their colour to the herbaceous border.

The Geraniaceæ can claim a few members in flower deserving of mention, such as *Geranium sanguineum* and *G. maculatum*; but this order, as far as the hardy members of it are concerned, does not at any time contribute much to our enjoyment.

Before I close my remarks, a few words relating to the matters of interest gleaned from the rockery adjoining the herbaceous garden, as also of the creeping plants I noticed upon the wall skirting it, may not be out of place. The rockery itself I consider a triumph of gardening skill, and it supplies a want which must have been long felt. The Ferns are *sans reproche*, but the greatest attention has evidently been centred upon the bog-plants, which have all the appearance of being thoroughly naturalised. *Lithospermum prostratum* covers the peat at one spot with a carpet of the deepest blue; *Cistus Clusii* and *Genista hispanica*, both from sunny Spain, together with *Cornus canadensis*, all commanded my special attention. *Anemone pennsylvanica*, much like *A. sylvestris*, and *Achillea rupestris*, *Phlox subulata*, and *Allium ursinum* complete my subjects for special mention in this part of the grounds. The wall dividing the herbaceous garden from the rockery is covered with a few creeping plants in flower. *Eurybia illicifolia*, *Exochorda grandiflora* are two of these, as also *Choisya ternata*, a Mexican shrub, just now covered with white bunches of sweetly-scented star-like petals, having evergreen foliage. The leaves, however, are ternate, a peculiarity which its specific name enjoins upon our memory. *Clematis montana*, on the same wall, is too well known for me to enlarge upon its beauties. On the side of the wall facing east are to be found in flower some single Roses, the names of which I append. A Rose in flower out-of-doors the first week in June, is an object that I daresay many of us would like to secure, yet why not? They are, *Rosa sinica*, a pink, single-flowered variety from China; *Rosa turbinata*, labelled S. Europe; and *Rosa sericea*, from the Himalayas. *W. de H. Scott.*

ANNUALS.

BESIDES the usual tender sorts, whose cultivation is entirely restricted to pots, there are many of the more hardy ones which, when well done, are very effective decorative subjects. Sometimes it is said that they are "weedy," when cultivated in pots, but however applicable this term may be in special cases, I daresay no one would ever think of applying it to the beautiful examples which are produced by the market growers. These growers seem to have the knack of turning out in superb form anything which they take in hand, and this, too, without much of the fuss and trouble often considered necessary by less successful growers; but however simple their systems of growing may be, they are well considered and adhered to. Of course private growers are somewhat handicapped in competition with their market brethren, inasmuch as the latter can devote large

spaces to special subjects, and thus secure more uniform treatment than those who are obliged to grow a heterogeneous collection of things, as private growers have to do. Yet the fact remains, that those specialties when well done are amongst the most useful and beautiful of decorative subjects, and amongst them are included several of the showy hardy annuals. The present will be found a very good time to put in a few batches; they will come in useful in autumn before the winter stuff comes on, but they are easily retarded or accelerated, as required. Perhaps one of the most prolific causes of failure is treating the plants too tenderly, when they become drawn and the stems unable to support the weight of the flowers, and which no amount of tying can remedy. Cool, light, well-ventilated pits or frames are very suitable structures for growing these annual plants.

In sowing the seeds, wooden boxes are to be preferred to pots or pans, the soil being more easily

FIG. 103.—EPIDENDRUMS. 1, E. O'BRIENIANUM, HYBRID BETWEEN 2, E. RADICANS AND 3, E. EVECTUM. (SEE P. 770.)

kept uniformly moist. Sow the seeds thinly and evenly, covering them according to their size, and using a rather free, light compost, which should be sufficiently moist, so that with due attention to shading from bright sunshine, little water may be required until the seedlings are up; but immediately they are above the soil all the light and air possible must be afforded them, taking care not to give this in such a way as to scorch the young plants. When the plants have made a few leaves—two or three—they should be pricked off into their flowering pots—48's and 32's being suitable sizes. Any porous rich compost will be proper for them, as they are not generally particular in this matter. After pricking off, keep them rather close for a few days, but as soon as there are signs of growth, give more air, and gradually discontinue shading; and when the weather is favourable the lights may be taken off, and as it is important that they should not be allowed to get so dry as to flag, it is better to plunge the pots in coal-ashes or sawdust. Among the more desirable sorts to grow are *Rhodanthe Manglesii*, *R. atrosan-*

guinea, and *R. maculata*, and the white variety, is the best. The pots may be packed tolerably full of plants, and a few small stakes inserted round the edges of the pots, with a neat bit of bast passed round them to support the plants.

Chrysanthemum tricolor and *C. coronarium* are capital alike for cutting and decoration, the dwarf double yellow strains of *C. coronarium* being specially good. Put one or three plants in a pot according to the size of pot employed and the time at which the plants are required. *Agrostis pilchella* is an exceedingly neat grass, and when sown thickly it rarely requires any other support. *Gypsophila elegans* has a very light and pleasing effect when intermixed in groups of other plants. Of taller subjects may be mentioned *Browallia elata* and the variety *Roetzlii*, which have pretty blue flowers, and are best grown two or three plants in a pot. Another good subject is *Schizanthus*, of which the varieties *pinatus*, *papilionaceus*, and *retusus* may be grown, these being sufficiently distinct for decorative purposes. One plant to a pot is best. *Celsia cretica* is a very different habited plant to any of the preceding, with long, erect, terminal racemes of yellow flowers, the latter of good size and substance. The plants last for a considerable time fit for use, and are biennial, but by sowing at the present time considerable progress will be made by the autumn, at which time they should be in their flowering pots. By keeping them in greenhouse temperature during the winter they will flower throughout the spring months. Sweet Scabious are always much admired, but more so when they are flowered indoors during the winter. Seeds for this purpose should now be sown and treated in every way like other annuals. Scabious and *Celsia* are best confined to one plant in a pot, keeping them fully exposed to sun and air as soon as they are established in their pots. *F. Ross, Bletchingley.*

NOTICES OF BOOKS.

HANDBOOK OF THE AMARYLLIDÆ; including the *Alstromeriæ* and *Agavæ*. By J. G. Baker, F.R.S., F.L.S., First Assistant in the Herbarium of the Royal Gardens, Kew. (London: Geo. Bell & Sons, York Street, Covent Garden.)

In his *Handbook of the Amaryllidæ*, which he has so long and so patiently worked on, Mr. Baker doubtless conveys much gratification to many an expectant student and lover of this showy and interesting class of plants who had previously had an intimation of the excellence of the intended work by means of the portions of it which have from time to time appeared in the columns of the *Gardeners' Chronicle*. Nor are we inclined to think that a perusal of the work as a whole can bring any other than increased gratification and pleasure with it, for the difficult and hitherto complicated subject has been treated by Mr. J. G. Baker in a manner only possible by one who has given the subject many years' study.

The Amaryllidæ includes sixty-one genera, with 670 species admitted, and these are divided into three tribes; the first (*Coronateæ*) comprising *Narcissus*, *Cryptostephanus* (one species), *Tapeinanthus*, and *Placea*. The second (*Amaryllidæ genuinæ*) embraces in its different sections (which are clearly defined by their botanical features) *Hippeastrum*, *Nerine*, *Amaryllis*, *Crinum*, *Sternbergia*, *Zephyranthes*, *Hemantus*, *Griffinia*, *Clivia*, &c. Tribe 3 (*Pantratiæ*) has *Eucrosia*, *Eucharis*, *Urceolina*, *Calliphuria*, *Hymenocallis*, *Eliseua*, &c. In Sub-order II., *Alstromeriæ* are dealt with in the same way as in Sub-order I.; and Sub-order III. (*Agavæ*) gives a welcome exposition of the *Agaves*, *Dorvantes*, and other allied plants. The division of plants into sections under some well-defined botanical characteristics, as Mr. Baker has done in his exhaustive and cleverly constructed work, is of inestimable service to both botanist and gardener. Say, for example, that a *Crinum* has flowered—one of which the possessor does not know the name, although he

knows one or two others of similar structure—by referring to Mr. Baker's book for the known species, and carefully running down the allied kinds in the same section, the unknown, if not quite new, may readily be identified. However, it is impossible to speak highly enough of a work of this kind, entailing labours of half a lifetime; the least those who are interested in the subject can do is to buy and study it.

FOREIGN CORRESPONDENCE.

MR. BRASSEUR'S NEW BOILER.

ON May 12 last I noticed an article in your journal, signed by Mr. Robert Warner, stating that, before any judgment could be formed on the merits of Mr. Brasseur's new boiler, it would be necessary to have a few more particulars respecting the diameter of the pipes, the dimensions of the houses heated, and whether these were sunk in the ground or not.

I have been employing one of these boilers since 1st October, and have great pleasure in sending you the results, after six months' trial. The boiler I employed was No. 3, and heated—from October 7, 1887, until April 13 last—four hothouses, all of wood, viz., an *Odontoglossum*-house, a *Cattleya* do., a *Cypripedium* do., and an *Azalea* do. They are all 66 feet long; three being 11 feet wide by 7 feet high, and one 19½ feet wide by 8 feet 2 inches high. They were built last year, and are situated in the open field, having no shelter of any description, neither walls nor plantations; and as the country here is perfectly flat, these houses during the winter were fully exposed to the bitterly cold weather we had for so long a period. They are not sunk, but level with the ground.

The inner diameter of the main pipes is 4½ inches, and of those that run through the houses 3½ inches.

The total quantity of fuel burnt was 8 tons of coal, and 386 hectolitres of large coke (a hectolitre = 2½ bushels, about)—costing altogether 369 fr. 30 c. (£14). During the first two weeks I only heated two houses, which cost 11 fr. 20 c., leaving 358 fr. 10 c. for the remaining twenty-five weeks, which gives an average of 14 fr. 32 c. per week, or 2 fr. 1 c. per day, or 51 c. per day of twenty-four hours for each house. Had I employed a larger boiler, I feel convinced that I should have burnt less fuel, as during the very severe weather we had, the boiler was obliged to be forced.

At night the gardener made up the fire, filling the cone inside the boiler about 9.30 P.M., and when he returned next morning at 6 A.M., he always found sufficient heat in the house. He simply had to take out the clinkers, replenish the cone half-full, to last until dinner-time, when he again replenished to last until night. By experience I found it was unnecessary for him to remain all night, which was a great convenience to him, and a great saving to me. The boiler was thoroughly cleaned out each Saturday at noon.

At Bailionville, where the estate of Mr. Massange is situated, the houses are of iron, about 50 feet long. The two *Cattleya*-houses are 19½ feet wide by 10 feet high, and sunk 1 foot into the ground; the *Cypripedium*-house is 10 feet 3 inches wide by 7 feet 3 inches high, and level with the ground. I enclose you a table from Mr. Massange, showing the daily variation of temperature, exterior as well as in the houses, and the coal burnt each day. This table you may publish, or communicate the details to any gentleman desiring them. The average 108 kilograms of coal for twenty-four hours represents at Bailionville an expense of 1 fr. 65 c. per day.

At the exhibition held in Ghent last April Mr. Brasseur heated, with one boiler (No. 4) the large temporary annex, built of wood. The length of this building was 250 feet long, 66 feet wide, and 42 feet high. One evening the boiler was filled at 7 o'clock, and at 9.30 next morning there was still a good fire.

I have no intention of entering upon the merits of the many good boilers made in England and elsewhere; but Mr. Brasseur, in taking the tubular

system as his base—constructing a boiler that can be placed anywhere without having to use masonry, but enveloping it in a strong isolator, together with the cone for holding a large quantity of fuel, &c.—has produced a boiler which will be a boon to the horticultural world, and especially to small gardeners, on account of the regularity of the heat, and the economy of coals and labour. *James Bray, 7, Rue Courte des Pierres, Ghent.*

THE OIL PALM AT LOANDA.

THE following notes on the African Oil Palm (*Elais guineensis*) are from a report on the products of Loanda, and are interesting as supplying an authoritative account of the manufacture of Palm oil from an eyewitness. Although the Oil Palm may be said to be a wild plant of these regions and requires no planting or cultivation, it nevertheless receives a certain amount of attention at the hands of the natives in the shape of pruning, lopping off dead and dying leaves, tapping some of the stronger leaves, with the object generally, it is thought, of improving the fruit. The huge spadices are said in some instances to bear, probably, as many as a thousand nuts or fruits, each about the size and nearly the shape of a pigeon's egg, of a bright red colour, tinged sometimes with yellow and in some cases deepening into black. The outer covering of the fruit is from ¼—½ inch in thickness, composed of fibrous matter and pulp, and containing the oil. To extract this the nuts are boiled and beaten to separate the oil from the pulp. This is afterwards skimmed off and put into pots ready for sale, and requires no further preparation. The hard seeds are cracked, and the kernels form an article of commerce, a fine white oil being produced from them. A few years ago the oil from this district was sold in Europe at about £40 per ton; it has now gone down to £20 and there is no prospect at present of any improvement in price, so many substitutes of a cheap kind, notably petroleum, being now employed in manufactures where at one time only Palm oil was used, such as soap, candles, &c. The substance of the kernel after the oil is expressed is used to make cattle cake. The only agricultural implements in use are the hoe and the hatchet.

TREES AND SHRUBS.

ABIES NOBILIS AND A. MAGNIFICA.

THE catkin-bearing branches of *Abies nobilis* and *A. magnifica* which I now send were cut from the upper branches of two trees growing in the gardens of Percy Bicknell, Esq., of Foxgrove Lodge, Beckenham, Kent. I have particularly noted the characters of the respective male catkins, but as the latter will soon be in your hands, there is at present no need for me to detail them.

There is nothing remarkable about the Foxgrove Lodge tree of *nobilis*, but it will serve our purpose as an object of comparison with the noteworthy *magnifica*. The latter grows some 30 yards from the principal entrance to the grounds, and is a conspicuous object viewed from that position; and from that point only have I observed it frequently during the past four years, and from its general appearance I was under the impression that it was *A. balsamea*. Only lately have I had the gratification of examining it closely and critically; and I need scarcely say that I was surprised to find it resolve into *A. magnifica*. I am informed that the plant was obtained from Mr. Anthony Waterer under the name *magnifica*. The habit had previously deceived me. This is well worthy of description; but before sketching this, allow me to state that I had not before seen an adolescent tree of the species. I had seen many plants up to 12 feet in height, but they were not adolescent—they barely presented tree characters. The tree at Foxgrove Lodge is only 16 feet high, but must have been decapitated or had its leader

shoot injured some years ago; for just below the two or three adventitious shoots, which have at last, and evidently reluctantly, been formed, the bole is quite 2½ inches in diameter. I say reluctantly, because Mr. Cochrane, the gardener—who takes a great and intelligent interest in trees, particularly those under his care—informs me that it has not lost its leader shoot within the last five years. The bole at 3 feet above ground is 27½ inches in circumference. Since the time the plant was 3 feet high it has lived twenty-one years. So that altogether it must be twenty-seven to thirty years old, and is still in vigorous health. The bole indicates an annual extension of leader shoot of from 9 to 18 inches. The primary verticils of branches are composed of from five to eight branches. The interverticillate branches, which may be said to be sub-verticillate, so close together are they as they issue from the stem, are from three to eight in number, and equal—indeed, in some instances exceed—in length the so-called primary branches; and this feature obtains from base to top of the tree. I wish it to be understood that two whorls of branches were formed on the stem annually. In this particular and, I believe, specifically unique character it agrees with all other individuals that I have seen. The branches may be said to be crowded: all are much deflexed, with their extremities upturned; and their circumferential spread at the widest is 9 feet 6 inches, and their annual extension 3 inches to 5 inches.

I am not aware how nearly these particulars coincide with the adolescent and old states of the species in its native habitat—its natural history is as yet imperfectly written in standard works—or even with vigorous plants, twenty-five to thirty years old, in this country; but readers of this may be in a position and willing to give the desired information. I am well aware that robust young specimens in this country have rigidly horizontal branches; but, I can hardly conceive that this habit will be permanent.

The development of branches from the stem between the whorls of branches is common to both Firs and Spruces, but such branches are usually developed in an irregular scattered spiral, and thus, fortunately, serve to break what would otherwise be a highly formal habit. In the case of *A. nobilis*, one to three—usually two—of such branches are developed, but they seldom attain to more than 18 inches in length before they perish.

With regard to the tree of *nobilis* growing in the garden at Foxgrove Lodge, it is, as near as I can guess, about the same age as that of *magnifica*. The annual growth of its stem, when vigorous, was from 18 to 24 inches. The branches are three to six, generally, to the verticil, and their annual extension 6 to 15 inches; their circumferential spread at the widest, 16 feet 6 inches. Normally *A. nobilis* has markedly fewer primary branches than *A. magnifica*, and never, so far as I can discover, produces more than one whorl of branches per annum. Much of the graceful individuality of *A. nobilis*—and the same may be said of *Picea orientalis*, the most graceful of Spruces—lies in the fact of its having comparatively few branches in the annual verticil. *Geo. Syme.*

FORMAN'S VARIETIES OF SKIMMIA OBLATA.

MR. Forman, nurseryman, Eskbank, Dalkeith, has for some years paid much attention to the improvement of *Skimmia oblata*, and has good reason to be proud of the results of his labours, for in habit of growth and form of foliage considerable improvements have been effected. The leaves in many of the male plants assume the proportions of the larger leaved hybrid *Rhododendrons*. This adds to their ornamental character. In this district they prove themselves fully as hardy as the *Rhododendron*—superior in that respect to the common and Portugal Laurels. But it is with a view to increasing their value as decorative greenhouse plants that Mr. Forman is more closely directing his operations, and it is in this direction that he has achieved most success. Many of the female plants in this collection are remarkably compact, and when grown in

8-inch pots they assume naturally the form of hemispheres of about 18 inches in height and the same width. Every shoot carries large terminal clusters of bright coral-red berries of last year's growth, whilst on many of the plants the berries of the previous year still nestle among the leaves. It is Mr. Forman's intention to exhibit his plants at some of the autumn meetings in London, when I feel sure they will be appreciated by all interested in good things for winter decoration. *W. S.*

ROSES.

WORK IN THE ROSE GARDEN IN JUNE.

THE most important month in the year for the Rose grower and Rose exhibitor especially, is now well advanced, but it may be still not too late to remind many who are interested in the flower as to what is necessary now, in order to secure successful blooming. I would remind those who see the grand blooms exhibited at shows, and who complain that they cannot have such, that this success is not attained without attending to some few things which are better done—even if the grower does not exhibit a stand, for—save in the matter of shading, which very much disfigures a garden, an amateur who is a non-exhibitor would do well to follow the example of those who do exhibit.

In the remarks I now make, and in the directions I now give, I have before me simply the lover of the Rose for its own sake. I will suppose that Rose shows do not exist, but that he is desirous of having good flowers. There are two aspects of Rose gardens to be seen now—one in which the beds are heavily mulched with manure, to the great delight of blackbirds and thrushes; and the other for which the mulching which covered them in winter has been raked away and the beds neatly forked over. The former will be the condition of the exhibitor's garden (most likely), the latter of the non-exhibitor. I mention this because the directions I give on the subject of watering are much more applicable to the latter.

Watering.—The drought with which we were threatened seems now improbable. I suppose last month was as dry a May as has ever been remembered, and consequently watering will be much more needed than usual; and this is especially the time to apply liquid manure; it is of no use waiting to do this until the buds are advanced—now is the time; nor must it be done sparingly; where water is abundant, there it will be well to give the beds a thorough good soaking—a bucketful to each Rose; and my advice would be, that it should be liquid manure. There is but little use in giving this when the buds are advanced—it should be done, before they are fully developed. The plan which I adopt is to have a large tub of liquid manure; it has generally been made with cow-manure and soot, but this year I have been so satisfied with Jensen's Fish Potash Manure and other things, that I have determined to try it with Roses. The strength of the manure is pretty good, and a certain portion of it is taken out, put into the can or bucket, and manure-water added. It is almost impossible to say exactly what proportions of the liquid cow-manure are used, but with Jensen's minute directions are given, and they must be adhered to. There are, unfortunately, situations where all these directions cannot be carried out. One friend last year said he might as well be told to give his Roses champagne, while another said "It is a question of 'tab' and Roses, so tub carries the day; but then I can give it to my pets afterwards."

Dishudding.—This is a process that the exhibitor never neglects, but which the amateur seldom practises. It consists in depriving each shoot of the Rose of all flower-buds except one, thus enabling the plant to throw all its vigour into a few blooms, and I believe if amateurs practised it more they would be thoroughly satisfied with the result. Where a few Roses are left to cluster together, they are poor in quality, and if you cut one it has a moderately short stalk, while

if you cut the whole bunch, you might as well have had one good Rose as a cluster of indifferent ones. Hence I would advise all who wish to have a satisfactory bloom, to follow the practice. It requires careful doing, so as not to crush the tender foliage or break the shoots. Get a piece of blunt stick or the blunt end of a quill toothpick, take the shoot carefully in one hand, and with the other take out the side buds, leaving only the central one; this will always be found prominent. It sometimes happens that this bud is deformed or injured, in that case it must be removed and one of the side ones selected.

Maggot Hunting.—This fashionable and elegant pursuit must be practised by the Rose-grower who does not wish to see the "worm in the bud feed on the damask cheek" of the fair flowers which he has cherished all the year—but all growers know what a pest it is: no time should be lost in rooting it out, for as this is the only way in which it can be overcome, nothing else but individual slaughter will avail, no general attack will be of any use—syringing, or anything of that kind—it must be a hand-to-hand fight. It is not a pleasant thing to have to squeeze a nasty soft squashy thing between your finger and thumb, but it must be done. Where it is possible it is well to instruct a couple of girls (they are more painstaking than boys) how to do it, and thus save oneself a nasty job; but, some way or other, it must be done, if a good bloom is to be secured. I believe that it is abundant in a good many gardens, but as yet it has not been very active amongst my own plants; still, I dare say it is coming.

Aphis Washing.—A good look-out for greenfly must be now kept; there is no accounting for its depredations; some years it is very abundant, and in some places, while others are perfectly free. It must be watched for, and the trees well syringed either with plain water, or water to which some insecticide is added; there is nothing less injurious to the foliage than Fir tree oil insecticide, as I have found that it does not injure the tenderest foliage; the syringing had better be done with a good deal of force, for if the aphides are not washed off they will soon recover the drenching and do a good deal of mischief. Quassia chips have been recommended by some, but amongst the many insecticides which are advertised to cure all the ills that plant life is subject to in the way of vermin, it will not be difficult to choose one for this purpose, although, perhaps, after all good clear water applied with force is as good as anything.

Wild Shoot Grubbing.—As few persons, comparatively speaking, grow Roses on their own roots, most of the Roses are grown on the Manetti or seedling Brier, and it is not uncommon to find the stock throwing up vigorous shoots, and (the grower being ignorant thereof), the Rose itself dead: in some of the best gardens of our great places I have seen this frequently occurring, even when under the care of an experienced gardener, and frequently the piteous complaint goes up, Why does this Rose never flower? and a vigorous bush of Manetti is pointed out—the bushes have been pruned, young shoots are pushing away, and if the underground shoots or suckers of either Manetti or Brier are allowed to grow certain death must ensue; therefore go over your beds every two or three days and spud up, or cut away closely any wildling growths that appear.

It will thus be seen that there is a good deal to be thought about by the Rose grower now, and not only thought about, but done. *Wild Rose.*

PROMISING NEW ROSES.

In reference to the interesting article in the *Gardeners' Chronicle* (p. 651), it may interest "Wild Rose" and your readers to hear that the new seedling Roses sent out last year by Messrs. Dickson, Newtonards, Earl of Dufferin and Lady Helen Stewart (hybrid perpetual), and Ethel Brownlow (Tea)—are very promising in the South of Ireland. Coming from the north to the south the growth is extremely vigorous, and the foliage just now very clean and

brilliant. I left Ethel Brownlow (Tea) out in a border last winter, and now strong shoots are rushing up from below; so that, with or without a greenhouse, those pedigree Tea Roses can be successfully grown. I see by a recent issue of the *Gardeners' Chronicle* another set will shortly be sent out. *W. J. Murphy, Clonmel.*

HOW DO MYTHS ORIGINATE?

I am not writing of Aryan or Scandinavian myths but of those connected with the Rose. We know how very easily, when once a myth is started, it passes on, and, unless contradicted, at last passes for reality. Not long ago I was sitting near a very well known horticulturist when a foreign firm was mentioned. "Ah!" said he, "I was with him the year that he brought out that fine Rose, called after him." "But," I said, "he never let out that Rose, it was sent into commerce by L——." I have always heard that the original Devoniensis was raised from a seedpod gathered in Mr. Foster's own garden. But be that as it may the rest of the tale with regard to Climbing Devoniensis is in my opinion, a myth. I have seen myself the original plant in Mr Pavitt's nursery, at Bath. It was about the year 1857—"Twenty years after Devoniensis had been sent out," I am now quoting Mr. Pavitt's own words (for to make assurance doubly sure I wrote to him asking for its history) "that a sport of Devoniensis started off and made a growth of 20 feet. I sold £10 of the buds to — of —, who wanted to claim it as his own."

This, I am perfectly persuaded is the true history of Climbing Devoniensis, and that the National Rose Society is quite correct in ascribing it, as it does in its Catalogue of Exhibition Roses, to Mr. Pavitt. It is not unlikely that since then other sports of similar character have been distributed, for there are some plants which make immense growth but bloom badly. The true, or Pavitt's variety, is, however, very feriferous, and although there is not as much credit in obtaining a sport as in raising a seedling, yet, honour to whom honour is due. *Wild Rose.*

HAYDON HALL, EASTCOTE.

In the spacious and lofty conservatory in Captain Edwards' garden is a wonderful example of *Bignonia Cherere*, which annually commences to bloom at this season of the year and continues throughout the summer.

The plant covers the greater part of the roof, and sends down innumerable sprays densely clad with axillary cymes of *Gloxinia*-like scarlet and orange-flowers, even reaching to and mingling with the fine Palms and other plants which occupy the centre of the building. Without doubt it is one of the most beautiful of climbing plants when well flowered, and Mr. Fry, the gardener here, who is a clever and thoughtful grower of plants generally, and specially successful with many considered difficult to manage, attributes much of his success to the plant being allowed to ramble freely, and to only cutting out those shoots which threaten to make the specimen too tangled and dense. By pruning it back as it is usually done, he thinks the flowering-shoots are cut away, and then the plant is accused of being shy-flowering. Although a native of a warm country (Demerara), a cool conservatory is necessary for it; in a stove it seldom produces any flowers.

The rockery at the end of the conservatory is very natural and effectively arranged, and the house is attractive with fine specimens of *Fuchsias* ns standards, *Pelargoniums*, *Roses*, shrubby *Begonias*, &c., tastefully arranged with Ferns and other foliage plants; while in the other houses are good batches of the charming blue *Salvia patens*, several varieties of scarlet *Salvia*, *Bouvardias* in all stages, *Eupatoriums*, *Poinsettias*, *Euphorbias*, *Carnation Souvenir de la Malmaison*, &c., and a very distinct and showy white and crimson *Petunia*, which is found very useful for such work—these

keep up the succession. Flowers for indoor and conservatory use and for cutting being greatly in request, we noted a fine lot of *Eucharis amazonica*, of *Gardenias*, also *Tabernaemontana coronaria* fl.-pl., a matchless strain of *Gloxinias*, obtained from seed of Messrs. Veitch's strain; a select lot of tuberous *Begonias* of Laing and Cannell, and *Pelargoniums* of Turner. Some well-grown *Calanthes* and other *Orchids* were in bloom, as *Cattleya Mossiae*, and a grand variety of *C. Meodelii*, *Dendrobium thyrsiflorum*, *Aërides odoratum*, and a few others. *Caladinms*, *Coleus*, large specimen *Adiantum cuneatum*, *Dracenas*, &c., also appear in proportional quantities; and the roofs of some of the houses are laden with flowers of *Allamandas*, *Stephanotis*, *Trachelospermum jasminoides*, *Roses*, *Abutilons*, *Tacsonias*, *Passifloras*, and other climbers and trailers, which give a never failing succession of flowers.

The long ranges of fruit-houses are in excellent condition, and Peaches were observed in large quantities and in all stages of growth; *Nectarines*, *Plums*, &c., were equally good. Of *Figs* there is a fine supply fit for table and for succession; *Grapes* are good and plentiful, and of *Strawberries* in pots a heavy crop has been gathered from first to last, the last crop being still in good bearing. *Pine-apples* and *Melons*, like all other things which Mr. Fry cultivates, are well done. Out-of-doors the *Rhododendrons* are just now very beautiful, especially the hardy herbaceous ones. So likewise are the double-flowered *Thorns* and other flowering trees and shrubs.

ORCHID NOTES AND GLEANINGS.

DENDROBIUMS.

THERE is much in this genus of *Orchids* to interest and claim attention, notwithstanding that they are less showy than the *labiata* section of *Cattleyas*, and devoid of colours as dazzling as some of the *Masdevallias*. Among the *Dendrobies*, then, we have forms as diverse in growth and appearance as it is almost possible to imagine them. As illustrating very opposite types, I would refer to *D. moschatum*, whose bulbs are from 5 to 6 feet long, and *D. aggregatum*, with bulbs seldom exceeding 2 inches. Again, compare the massive *D. speciosum*, with bulbs as large as a child's arm, with *D. Falconeri*, whose lengthened pseudo-bulbs are scarcely stouter than a goose quill; and in the manner of blooming contrast the clusters of *D. nobile*, *D. Wardianum*, *D. crassinode*, *D. Pierardi*, *D. aureum*, and many others that bloom along the greater part of the pseudo-bulbs, with the pendulous racemes of *D. densiflorum*, *D. Farmeri*, *D. thyrsiflorum*, *D. Schroderii*, &c.; or with the more open arching sprays of *D. clavatum*, *D. Paxtoni*, *D. fimbriatum*, *D. suavisimum*, *D. chrysolobum*, and others similar. Then *D. ligibbum* and *D. superbiens*, the trusses of *D. formosum*, *D. eburneum*, and *D. Jamesianum*, &c., have spikes of flowers standing erect, whilst those of *D. senile*, *D. japonicum*, and *D. Jenkinsi* are placed singly.

For pure white with but just a tinge of yellow or orange in the throat, there is *D. formosum*, *D. Jamesianum*, and *D. eburneum*; and among species which have flowers that are white with a shade of green, is *D. Dearei*. Golden-yellow is represented by *D. densiflorum*, *D. clavatum*, *D. aggregatum*, *D. chrysotoxum*; primrose-yellow we find in *D. luteolum* and *D. heterocarpum*. Buff and brown in *D. Dalhousianum* and *D. albo sanguineum*; bright rose and purple colours in *D. bigibbum*, *D. moniliforme*, and *D. Freemanii*; whilst in *D. Falconeri*, *D. Wardianum*, *D. nobile*, *D. crassinode*, *D. Devonianum*, &c., we have rose and purple tints, white and yellow most charmingly blended in lighter or darker shades of the latter according to the variety or the season of its blooming.

Besides these species there is the strange bulbous species *D. crumenatum*, which has the extreme tip of the pseudo-bulb lengthened out into a bloom-spike,

on which the flowers continue to open out for some considerable length of time, but the individual blooms last only for a day, and the perfume is delicious. With such strong claims on the gardener's consideration it is not surprising that very great quantities are imported. A large number of the species are of a pendulous habit of growth, and therefore good for growing in baskets; they should be treated to plenty of heat, light, and moisture, the growth then becoming very sturdy, and flowers are freely produced. *Dendrobiums* when potted should have a pot just sufficiently large to hold the plant, so that no excess of potting material can be placed about them, a constantly damp soil causing the roots to decay, more especially if the plants should be at any time incautiously watered and especially in the resting period. *Vanda*.

THE ARAUCARIAS.

LET those who are disposed to boast of a descent from the Conqueror, or to talk of origin from Noah or Adam, hide their diminished heads when they are confronted with the *Araucarias*. Ages before the surface of the globe was fashioned as we now see it, before the periods when our land was covered with

are well equipped against storm or wind, or wide variations of temperature, and this may account for their persistence to this day. The grace and elegance of some, the monumental grandeur of others, compel respect even independently of their wonderful history and their botanical interest. A short time since we illustrated the Norfolk Island Pine, *A. excelsa*, as growing in Dr. Bennet's garden at Mentone, (p. 619) and as seen in many a conservatory in this country, and we noted the regular tiers of its branches and its soaring habit. *A. Cunninghamii* was also illustrated from a plant growing in the Temperate-house at Kew; (p. 685) and now we give an illustration of another species, *A. brasiliensis* (fig. 104, p. 775)—a native, as its name implies, of the southern parts of the Brazilian empire, and of which noble specimens may be seen in the Temperate-house at Kew, the graceful branches downward bent, and thickly beset with broad shining green lance-like leaves. How different the habit becomes as the tree gets older, may be seen from our illustration of a tree growing in Barbados, and a photograph of which was given us by the late General Munro, who told us it was known by the name of the Candelabra Tree. The older leaves gradually fall off, leaving the spreading

FIG. 104.—ARAUCARIA COOKII: ISLET OFF NEW CALEDONIA.

ice, before the London clay was laid down, or the chalk deposited, long, long before oolite or lias, away in a period so remote that the human mind cannot fathom it, in the ages when the coal plants were growing in Britain, *Araucarias*, or their immediate progenitors, were in existence. Their pedigree, and those of their successors, together with their sign-manuals even, may be seen in the natural history museums, in rocks of various formations, and diverse age from the coal measures to the more recent deposits. How old the remotest *Araucaria* may be it is, as we have said, beyond our ken to even imagine. Perhaps the remark of an old sailor to us as we were conversing with him on some fossils washed up on the beach is as near an approximation as it is possible to arrive at. "They do say, sir," said he to us, alluding to a left-handed *Fusus* from the Suffolk crag, "as they was formed before the world was drowned." In any case the *Araucarias* are of untold antiquity, and more than once upon a time they formed part of the forest vegetation of this country, as their successors still do in various parts of the southern hemisphere. Their structure is somewhat complicated—we need not enter into detail concerning it here, but we note it as we write, because the fact points to a still more remote period than that in which *Araucarias* are at present known to have existed—a period when the structure was presumably simpler. In any case, *Araucarias*, or most of them,

branches bare, except for a globular tuft at the end. More extraordinary still is the *Araucaria* of New Caledonia, *A. Cookii* (figs. 104 and 106), figured in our columns by the Rev. R. Abbay, in January 20, 1877. The tree attains a height of 200 feet, and has the peculiarity of shedding its branches for five-sixths or more of its height, and replacing them by a smaller and more bushy growth, so that the tree has a columnar appearance, the summit being crowned with a mass of foliage like a capital. The "evergreen" tree is deciduous in its fashion, and the loss to the tree of one set of leaves, (whose action, moreover, would be impeded by the dense shade of their neighbour), is compensated for by the new growths from the trunk. This habit of producing new shoots from the trunk is common in some *Conifers*—*e.g.*, *Pinus rigida*.

SMUT AFFECTING WHEAT.—The Director of the Central Experimental Farm, Ottawa, Canada, has commissioned Mr. Fletcher to draw up an account of the smut in corn. Mr. Fletcher has accordingly availed himself by permission of some illustrations of the fungi made by Mr. W. G. Smith. The remedy most approved is sulphate of copper, 1 lb. of which is dissolved in 5 quarts of boiling water for every sack of 4 bushels. The wheat is soaked for ten minutes, or the 10 pints of the solution may be poured over till all is absorbed.

COLONIAL NOTES.

GLADIOLUS LUDWIGII.

This species is very little known at home, yet it is not undeserving of mention. The leaves are long and narrow; the stem often 4 feet high, bearing some two dozen pairs of two-ranked, delicate, pale rose flowers, each about 1½ inch long and half an inch across. The plant grows in black loam on hillsides amongst grass, and is the latest flowering *Gladiolus* we have. It flowers in May, and might flower through November if cultivated in England, but in order to do it justice space must be found for it under glass.

GERBERA JAMESONI.

One of the most splendid herbaceous plants seen by me in a recent visit to the Transvaal, and very well worthy of cultivation.

Harvey enumerates fifteen species of *Gerbera*, of

white; *H. Cooperi*, fatidum, lanatum, splendidum, all yellow; and *Helipterum eximium*, ruby-red. Of all those growing in Natal *Helichrysum adenoearpum* is the finest, and is largely gathered by colonists for winter bouquets. It grows over a wide extent of country at from 2000 to 5000 feet elevation, and varies in colour from pale rose to red. The plant is 2 feet high, the stem and leaves woolly, bearing four to six flowers three-quarters of an inch across; these, when gathered just before the flowers are fully expanded and made up into neat bunches, look very bright and pretty, and retain their silvery rose tint for years.

BULB CULTIVATION IN NATAL.

Taking the hint which Nature has given us in bestowing bulbous plants on South Africa in greater profusion than in any other part of the world, we have amongst us some cultivators who are working up a stock of bulbs with a view to export the same to the home markets. It must be borne in mind

in my time, but this seems a model of what a descriptive bulb list should be, and I venture to say that the nurseryman, amateur, and collector may all learn from its pages. *R. W. Adlam, Maritzburg, Natal.*

BOTANIC GARDEN, KING WILLIAM'S TOWN.

According to Mr. Leighton's report for 1887, it appears that the gardens are fulfilling in a very substantial degree one of the main purposes of such establishments. They are becoming more and more a centre of supply to the border and Transkei districts. The garden depends for a large share of its income upon sales—a vicious system, but one which may be inevitable under local circumstances that we are not in a position to appreciate.

AGRI-HORTICULTURAL SOCIETY OF MADRAS.

The annual report for 1887 shows the Society to be in a flourishing condition. The library is the best in Southern India. Numerous economic plants have been distributed from the Society's gardens. The tree Tomato, *Cyphomandra betacea*, has proved a success in Southern India. The annual flower show was held on February 25, 1888, when a fine display of Ferns was exhibited.

EMIGRATION OF GARDENERS.

Queensland.—In your paper of February 28 there was a short paragraph, signed "Emigrant," which is a kind of answer to some one who recommends emigration to gardeners. "Emigrant" wants to know in which of the colonies a gardener is most likely to succeed. I have been in this colony twenty-four years, and do not know anything about any of the others, but have often wondered that more gardeners do not come out here. I do not recommend any one to come here as any person's gardener, for here a man can soon get a home of his own, and be his own gardener. I do not for one moment wish to make any one think a man can pick up a fortune in the road on landing—nothing of the sort. If any one come, it should be with the intention to work; not being too particular what he begins with, but always having in view the prospect of living under his own Vine and Fig tree, which a man can do here if he chooses. He may not amass great wealth, but he can raise himself above the fear of poverty in his declining years, and his children will be a blessing to him, and he need not fear, although he has a score of them. Here the climate and land are good, and there is plenty of the latter for both horticulture and agriculture, and the great want is good practical men to take it up for themselves and cultivate it. I have enclosed a copy of directions for obtaining the land, &c., when here. *Benjamin Crow, Gr., Toowoomba, Queensland.* [These conditions would occupy too much of our space, and we only say that the terms offered are exceedingly advantageous to either small or large occupiers. Doubtless the conditions of hire or purchase can be obtained at the office of the Queensland Government in London by any person making proper application. Ed.]

CROSSING GRAPES.

Queensland.—Dr. Bancroft sends us seeds of various crosses effected by him between certain European and American Grapes at Brisbane. It is curious to observe the different powers of resistance offered by the varieties to the onset of disease. This alone is a reason why experimenters should continue their work. Dr. Bancroft adds a practical wrinkle, which is worth noticing. In order to facilitate the germination of the Grape-seeds, Dr. Bancroft files off a little piece from the thick end of the seed, and thus allows free access of water to the embryo and proportionately earlier germination. Flat China Peach seeds seldom germinate, says Dr. Bancroft, unless the stone be opened by grinding it on a grindstone.

White Grape—a cross between Sweetwater and Isabella. Thick skin, with a very peculiar flavour not subject to oidium, but takes black spot on low land.

Black Grape—a cross between Black Hamburg

which *G. aurantiaca* is the finest one native to Natal; but it is far beneath the first-named in size and colour of flower, and with the habit of a *Gazania*, to which *Gerberas* are allied. *G. Jamesoni* has pinnate Dandelion-like leaves about a foot long, and throws up two to four flower-stems 2 feet high, bearing an intense vermilion-red flower, which in a specimen cultivated here measured 5½ inches across. It grows near Barberton, Transvaal Gold Fields, amongst stones, in heavy black or red soil. It flowers in the summer and autumn, but coming from such a warm district, I do not think it is suited for outdoor cultivation in England. The flowers last several days without changing colour. Seed has been sent to the Cambridge Botanic Gardens.

HELICHRYSUM ADENOCARPUM.

Out of the 137 species of *Helichrysum* or Everlastings which grow wild in South Africa, but one, *H. vestitum*—the well-known white Cape Everlasting of the trade—has been hitherto exported in quantities to Europe for decorative purposes. Several others, however, are worthy of attention, viz., *H. elegantissimum*, silvery

that I speak only of such bulbs as can be cultivated in the open without any protection whatever. On the coast a beginning has been made with *Eucharis amazonica*, *Paneratium earibatum*, *Amaryllis vittata* and hybrids, *Zephyranthes rosea*, and the commoner *Caladiums*. In several nurseries up-country the following are in cultivation:—*Tuberoses*, *Lilium Harrisii*, *L. aurantiacum*, *L. longiflorum*, *L. speciosum*, *Freesias*, *Ornithogalum*, *Lachenalias*, *Ixias*, *Babianas*, *Sparaxis*, and *Nerines*, but, strange to say, not hybrid *Gladioli*; garden hybrids have been tried, but are not a success. Doubtless there are many other bulbs which would thrive with us, such as *Calochorti*, the improved varieties of *Clivea*, and *Montbretia*, *Habranthus pratensis*, and other *Amaryllideæ*. Bulbs whose home is in the latitude of temperate Europe, as *Tulips*, *Hyacinths*, *Jonquils*, *Narcissi*, *Ranunculi*, *Crocuses*, *Anemones*, find South Africa rather too warm; at least, one never sees good flowers of any of the last named. And here I cannot omit to mention a catalogue so full of information that it deserves a wide circulation—I refer to that of Messrs. A. Roozen & Son, Overveen, Haarlem. I have perused a good many trade lists

FIG. 105.—ARAUCARIA BRASILIENSIS: THE CANDELABRA TREE. (SEE P. 774.)

and Isabella. It fruits well in Brisbane, and does not suffer from Oidium or black spot. Birds are very fond of picking it.

A. "Iona"—fertilised by the large black Morocco Grape: ripe Jan. 18, 1888.

B. "Iona"—fertilised by Sweetwater: ripe, Jan. 18, 1888.

MR. W. S. KIMBALL'S WATER LILY HOUSE.

[SEE SUPPLEMENTARY SHEET.]

MR. GEO. SAVAGE, gardener to Wm. S. Kimball, Esq., Rochester, N.Y., in accordance with the request of the Editor of the *American Florist*, sent the following description of Mr. Kimball's aquatic-house, of which we now give an illustration from a photograph:—

"The dimensions are as follows:—House, 76 × 26 feet; water-tank, 58 × 20 feet; height of house, 15 feet. So you will see there is not much space wasted on the sides for walks, and the Lilies have an abundance of room to fully develop their large leaves.

"At the lower end of the tank *Nelumbium speciosum* is planted; it is confined by a brick wall, to keep it from spreading all over the pool. In the centre is the grand *Victoria regia*, which has flowered several times this season, and has been admired by thousands of people. Distributed about the tank are the best selection of *Nymphaeas* that can be grown; they include the following:—*Nymphaea zanzibarensis*, N. z. *azurea*, N. z. *rosea*, N. *dentata*, N. *rubra*, N. *cornulea*, N. *Sturtevanti*, N. *devoniensis*, and others of the choicest varieties. Other things are grown in the water, such as *Cyperus alternifolius*, *Papyrus antiquorum*, which flourish magnificently.

"To make a background at the farther end of the pool, there are planted in a bed of earth *Musa Cavendishii*, M. *coccinea*, M. *rubra*, and M. *vittata*, their large leaves having a very good effect when seen from the upper end. At the north end are planted hard-wooded plants like *Allamandas*, in variety, and *Bougainvillea glabra*, which blooms profusely almost all the year round.

"Besides being an aquatic-house, it is very useful for Orchids that require a nice light, airy position. I have at the present time (early winter, 1887) lots of *Laelia anceps*, L. *albida*, and L. *autumnalis*, hanging from the roof, which gives the house a very much better appearance than the photograph shows."

VEGETABLES.

A VERY SUPERIOR LATE BROCCOLI.

My attention has been drawn for two seasons running to a very superior Broccoli, viz., Hanan's Protecting Late White, samples of which I send you. It is the latest we have or know in the North, and on that account alone it is worthy of being widely known. Sown in the beginning of April it comes into use in June, and lasts till the first crop of Cauliflower come in. It is superior in quality, as you will see by the sample forwarded to you this day. This sample is below the average in size, the prolonged drought of last summer and autumn having crippled the growth after they were planted out, yet they are even in point of size and very good samples. As regards constitution it is the hardiest sort we know in the district of Edinburgh, and I think it should be a valuable sort for Southern growers. S. [A very short stocky form. Stem 2 inches in diameter, with leaves down to the soil almost; the heads creamy-white, nice shaped, hard, and protected, with a profusion of unfolded leaves. Ed.]

METHVEN'S EDINBURGH LATE BROCCOLI.

This Broccoli is one of the best for late use, and one which has proved very hardy here this season. Where late Broccoli are in demand, and there is some difficulty in getting Broccoli to stand through the winter, I would recommend growers to try this variety. We are cutting beautiful heads of it now,

and there will be a very short interval between it and our early Cauliflower. It is also of the best quality. J. Robertson, *Cowdenknowes, Berwickshire, June 11.* [See our Notices to Correspondents in this issue. Ed.]

FLORISTS' FLOWERS.

PANSIES AT CHISWICK.

A LONG north border at the Chiswick Gardens is planted with a number of Continental varieties of Pansies. Each reputed sort is in a patch by itself, mainly from the collection of Mr. E. Benary, Erfurt. Considering the character of the winter, they have come through it pretty well, for as a rule there are few vacancies in the beds. Whether they would stand through a hot summer in this country is perhaps a matter for doubt, as they do not appear to possess the vigorous, tough, and compact habit of our English-raised varieties, being apparently of taller and spare growth: but as they are overshadowed by the dense growth of a line of standard Plum trees at the back, the plants have become somewhat drawn, and this, as a matter of course, would affect the habit. The colours and markings are in the cases of some of the varieties remarkably striking, and the striped varieties give us a section that our English raisers appear to have neglected. We have but very few striped varieties among our many hundreds of named fancy Pansies. It may be remarked that with but few exceptions the varieties come pretty true from seed. Taking them as they are growing the first is violet, bordered with white, of which there were two or three types; that which appeared to be truest to character had flowers of a deep shade of violet, with a distinct marginal line of white. Another variety, named Mahogany, has bright crimson flowers of good shape, very free and striking, but varying slightly in character. This yields a delightful mass of bloom. Crimson Purple, marbled with yellow, is a showy and fairly uniform type. The striped, as before stated, are very pretty, and they vary much in character. I have on several occasions made selections from the finest Continental striped flowers, only to find that they die during our warm summers. A bed of these striped Pansies would have a charming effect, and in planting from the seed-bed it would be well to put them in thickly, so that any rogues could be pulled out.

It is better to thin out than to have to plant to supply vacancies. One called Quadricolor is, as its name implies, a four coloured Pansy, a yellow ground with large dark spots at the side. Emperor William, a good blue; the flowers large, of good shape, and having a dense large black blotch in the centre. Seedlings vary somewhat in the depth of the blue; it comes nearly true from seed. Golden Yellow is a very good golden type of a small Pansy, very free, and a good bedder. White is also good and true. Twin-coloured is a variety having bronzy-orange flowers, the upper petals much tinged with salmon-brown. Large-flowered is represented by big white ground flowers, which partake both of the characters of the English show and fancy types. Snow Queen is a white Pansy, generally good in quality, and pretty true from seed. King of the Blacks is an old glossy black variety, found in some catalogues under the name of Faust. Aurea pura is pure gold, and some very useful yellow bedding varieties can be obtained from this. Tricolor maxima is represented by a large Belgian type. Azure Blue is pale blue, and what would be considered washy by some; the probabilities are the colour would burn under sunshine. Havana Brown is a kind of dark cinnamon colour edged with brown. Bronze is of a reddish-bronze colour, edged with yellow; some of the types are very showy. Cliveden White is a fairly good white, differing a little from seed, but unlike the old Cliveden White of a quarter of a century ago. Lord Beaconsfield is a deep purple-coloured Pansy, edged with white, and comes true from seed; very free and striking. Cliveden Black, Cliveden Purple, and Cliveden Yellow are pretty good bedding varieties, the latter representing a good form of *Viola lutea grandiflora*. R. D.

THE BULB GARDEN.

THE FRITILLARIA.—When taking a few notes amongst the bulb gardens in Haarlem and its vicinity, I visited, amongst others, the celebrated hardy plant nursery of Messrs. Krelage & Sons, in Haarlem. At that time—end of April—the leading feature in the nursery, besides the ordinary Hyacinths, Tulips, &c., were the Narcissus and Fritillarias. The last-named have been cultivated here for many years, and a very large space of ground is set apart for the varieties of *F. meleagris*. It is an old English garden plant, and one that was much esteemed when exotic plants were scarcely heard of. There is some variety of colouring found amongst them, from pure white, or white with a greenish tinge, to the usually maroon-purple chequered varieties. Probably the numerous forms in the possession of Messrs. Krelage have been produced by crossing other species with it. The deep yellow ground on some might claim the parentage of *F. Moggridgei*, and others that of *F. pyrenaica*, but it may not be beyond the art of the hybridist to produce the whole of them from the common species—*F. meleagris*. Some varieties are very tall and vigorous, others are dwarf and not at all free in growth; but, like delicate children in some families, they may be even more valued on that account.

There might be good stocks of some half-hundred varieties, and I went carefully over them, noting the most distinct in growth and flowers. The colours range from pale yellow with scarcely any markings upon them to rich chocolate heavily chequered. Theresa Schwartz is a pale form, marked with brown on yellow ground; Paul Kruger is glossy chocolate, heavily chequered; Arentine Ardenser, greenish-yellow, chequered reddish-brown; Mr. Dullert, crimson-brown, heavily chequered; Siegfried Haarlem, greenish-yellow, slightly chequered a reddish-brown colour; David Blés, yellow, faintly chequered red—a dwarf-growing variety; Stieltjes, heavily chequered maroon and yellow—a vigorous plant; Van Lerijs, medium, blood-red chequer, vigorous in growth; Alma Tadema, pale greenish-yellow, with rosy-red and medium-sized chequer; Rembrandt, maroon-crimson heavily chequered; E. H. Krelage, heavily chequered chocolate-red on yellow—an excellent plant; W. J. Holdwijk, rich maroon-crimson, heavily chequered. The above is a dozen of the best varieties which I noted in the collection. Some two years ago this firm sent a selection of them to be inspected by the Floral Committee of the Royal Horticultural Society, and these were greatly admired at the time by some members of the committee, and selections from them were awarded certificates, but cut flowers that had made a long journey, and were crumpled and faded, gave a poor idea of the beauty of the flower, and the effect produced when seen in masses of varied colours.

Fritillarias are grown without much trouble, their place being in the herbaceous border, where they should be planted in groups, and allowed to remain undisturbed for several years. A deep, sandy loam, moderately moist, is better for them than a light, shallow, or gravelly soil.

I have grown several distinct species in pots, also the white and ordinary forms of *F. meleagris*, with success, the flowers being greatly admired, coming as they do before any are in flower outside. Repotting should be done annually, but the bulbs themselves should not be disturbed until in the course of time, they become too numerous, and therefore crowded. J. Douglas.

PROLIFEROUS MARIGOLD.—From the Chelmsford "Odd Volumes" we have received a specimen of an odd Marigold, consisting of an odd number (five) of flower-heads proceeding from the sides of the normal flower-head, which has thus an odd appearance strictly akin to that presented by the Hen-and-Chicken Daisy. It is due to luxuriant growth, resulting in proliferation of the inflorescence.

PLANTS AND THEIR CULTURE.

ARISTOLOCHIAS.—These plants have very singular and grotesque-looking flowers, which, unfortunately for garden purposes, have in some instances rather a foetid odour; but, by selecting a suitable position, no inconvenience need be experienced in growing even these. Aristolochias have generally a climbing habit of growth, and are seen to best advantage when allowed a fair amount of space to grow in, such as on the rafters of a lofty house, where, if their shoots can be allowed to hang down, is the best possible position for them. Their bird-like, or pitcher-shaped flowers are then well displayed, without much risk of their being brought too close to the spectator. Most of the species are easily grown in a fairly rich and porous compost, and do best if they are planted out, although they may be satisfactorily grown in pots; indeed, few species are best grown so. *A. Thwaitesii* is one of those well suited for a pot, being a dwarf-evergreen shrub, rarely growing more than 2 feet high, and as it flowers from the thick rootstock, just at the surface of the soil, it is well to keep this part raised when potting the plant. The racemes of flowers are produced in early summer, and are tubular in form, with a pouch at the base, and a tail to the lip, in colour yellowish outside, and velvety dark brown inside. It requires stove temperature. Another dwarf pot species is *A. ciliata glauca*, a greenhouse herbaceous plant, growing about 18 inches high, and producing freely in autumn deeply fringed, broad-lipped, glaucous green and purple-spotted flowers; it seeds freely, and can be easily propagated in that way.

Of the tall-growing sorts, *A. ornithocephala* is one of the most striking, the flowers being beautifully reticulated, and marked with purple-brown on a greenish-yellow ground; the two-lobed lip is usually from 6—8 inches across; the tube or pouch of the flower is large, and the beak, which is about 4 inches long, is lined with dark coloured hairs, giving it the appearance of plush velvet; the leaves are large, somewhat heart-shaped. The plant has a twining habit, and is one of the largest growing stove kinds.

A. trilobata, a climbing species, with neat, three lobed, dark green leaves, is of more moderate dimensions than the last named, and never fails to produce a profusion of flowers, which in shape seems to be made up from a small *Nepenthes* (such as *gracilis*) and one of the tailed *Cypripediums*, with the characteristic *Aristolochia* pouch at the base of the pitcher, the tail being produced from the lid of the pitcher.

A. elegans is a beautifully marked species, of moderate dimensions and of rapid growth in a stove temperature. A rather rare species is *Goldiana*, and which requires some care in affording it a long growing and a season of rest. The flowers are about as large as a man's hat. *A. gigas*, *A. Duchartrei*, and *A. tricandata* are all worthy of being included in a collection. The plants are easily propagated from cuttings and are not subject to the attacks of insects, the syringe usually keeping them clean. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

RHODODENDRONS AND AZALEAS.—Pick off the seed-pods from the shrubs as fast as they go out of bloom, particularly from young plants. Where the transplanting of large specimens and thinning out of old clumps is contemplated during the coming autumn months, see that each plant has a label attached to it, with its colour written thereon, as this will permit of the colours being effectively arranged, and save the labour of lifting wrongly placed plants in succeeding years. Pay attention to watering in dry weather all those that were planted rather late in the season, and if mulching was neglected, then apply it now, as it will be of benefit even at this late period.

Hardy Biennials.—Most of those that were sown in the early part of last month, including *Antirrhinum*, *Brompton Stock*, and *Campanula calycanthema* and varieties, will now be large enough to handle, and it will be desirable to prick them out into reserve beds of not very rich soil, covered with a light dressing of finely sifted leaf-mould and sand, which should be raked in with a fine-toothed iron rake; afterwards smooth the bed over with the back of a spade, preparatory to pricking out the young plants in rows about 3 inches apart each way. Haud-weed when necessary, and water when required.

Carnations.—In some districts these have fared badly in the last two winters, and the stock is getting weak. Where this is the case no pains should be spared to work up a sufficient quantity, and with this object it will be a good plan to cut off all flowering shoots from last year's layers, so that stronger shoots may be obtained for layering, *i.e.*, if flowers can be conveniently dispensed with. Layering may be commenced as soon as the shoots are sufficiently advanced in growth for this purpose. I shall make a

Outdoor Ferneries.—Beyond weeding and an occasional cleaning little will require to be done here for the next few weeks. Examine all that were planted in the early part of the season, and until they have become well established see that they do not suffer from want of moisture at the root, the plants being very sensitive in this respect. It is essential that "filmy," such as *Hymenophyllums* and *Trichomanes*, have an abundance of moisture at all times, atmospherically and at the roots, and for this purpose they should be grown near running water. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

Figs.—The crop from the earliest trees being now gathered the trees should have a good cleansing prior to starting them to swell their second crop, the lessening of moisture at the root during the ripening stage tending to give the trees a rest. Insects which affect the Fig will also have increased; these may, however, be lessened in numbers by syringing the trees with rain-water heated to a temperature of 85° or 90°, into which is poured a wineglassful of double refined petroleum to every 3 gallons of water. Well work the syringe about in the vessel, and be careful not to draw from the top. This work may be done on every other day, and a good wash with the garden-engine and clear water on intervening days. Give the plants a fresh top-dress with loam and Thomson's Vine manure, well soaking the roots with weak manure-water at the same time.

Succession-houses.—If all has gone well these will now be supplying ripe fruit; a drier atmosphere will, therefore, have to be maintained. In order to prevent the cracking of the fruit, syringing must only be done very sparingly, and this only after all the ripe fruits have been picked for the day, and these should not be plucked until they are nearly bursting, the flavour then being much better. But in plucking fruit to travel a long distance, or to be sent to market, it should be picked in a tender, but not ripe stage,—but these are never of high flavour. Late trees, from which only one crop of fruit will be taken, should have abundance of air, and copious waterings at the roots. The points of the shoots are better left unpinched in this instance, successional crops not being desired; and any fruits which show after the main crop is thinned should be removed.

Orchard-houses.—Cherries where the fruit is ripe and still hanging, require abundance of air, the floor of the house being made slightly damp once on bright days; some shade should also be placed over the roof to prevent the sun's rays beating upon the fruit; this should, however, be portable and should be removed when there is no sunshine, else the foliage will lose much of its texture. Every precaution must be taken to exclude birds. The later sorts will advance rapidly and every care must be taken to keep the foliage clean prior to the colouring stage. *Bigarreaus* being very impatient of moisture, and if rain or other water gets on the fruit at the colouring stage, the skin of the fruit is almost certain to split.

Plums must receive abundance of water with copious syringings, and sprinkling of the paths twice daily. Avoid strong doses of ordinary manure-water, as this often acts injuriously on the flavour of the fruit; rather have recourse to some concentrated form of manure, as Thomson's Vine manure or Wood's Le Fruitier. Where the trees are in pots they are more manageable than when planted out; as any trees which are barren can be turned out-of-doors and plunged to the rim of the pots in coal-ashes, in which situation they are certain to have the wood well matured for next season. Thin and pinch the shoots to induce the formation of fruit-buds. *W. M. Baillie, Luton Hoo.*

FIG. 106.—ARAUCARIA COOKII, TO SHOW HABIT. (SEE P. 774.)

beginning with a few of the forwardest during the coming week. Use for this purpose a good sandy compost, with a liberal supply of leaf-mould added thereto. Of course it is too soon to begin with the general collection.

Rockeries.—These will require to be again weeded. Cut off all flower-stems from plants that are past their best, or are going out of bloom, except in cases where seed may be required, and at the same time any plants that have grown beyond their allotted space may be cut back, so as to keep them within bounds. Nothing betokens neglect more than to see one species encroaching on its neighbour.

INFLUENCE OF THE MOON UPON VEGETATION.—A committee has been appointed in the island of Trinidad to investigate this matter. The Proceedings of this committee have been lately published. Moon-beat is so trilling that of itself it can have no influence on vegetation. According to the document before us, the heat of a bright, full moonlight night means only an increase of temperature of 1-5000th part of a degree Fahrenheit. As to moonlight, a comparison of Dr. Wollaston's is quoted, wherein it appears that sunlight may be compared to 5562 wax candles at a distance of a foot, and that of the moon as the 1-144th part of a single candle at the same distance.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, JUNE 26 { Royal Horticultural Society; Scientific, Fruit and Floral Committees.

SHOWS.

WEDNESDAY, JUNE 27—Alexandra Palace Rose (two days).

THURSDAY, JUNE 28 { Royal Horticultural Society of Ireland. Brockham Rose. Ryde Rose. Stratford and Ilford.

SATURDAY, JUNE 30 { Eltham Rose. Reigate Rose.

SALES.

MONDAY, JUNE 25 { Orchids in Flower, at Protheroe & Morris' Rooms.

TUESDAY, JUNE 26 { Collection of Orchids, formed by F. A. Philbrick, Esq., Q.C., at Protheroe & Morris' Rooms (two days).

THURSDAY, JUNE 28 { Imported Orchids, from Messrs. Shuttleworth, Carder, & Co., at Stevens' Rooms. Established Orchids, &c., at Stevens' Rooms.

FRIDAY, JUNE 29 { Imported Orchids, at Protheroe & Morris' Rooms.

Grapes New and Old.

ACCORDING to a statement in the *Vigne Américaine* the Grape known as Gros Colman, or Gros Colmar, was introduced into commerce in 1850 by M. MOREAU ROBERT, a nurseryman at Angers, the variety having been, as he alleged, obtained by him from seed. Mr. BARRON, in his excellent book on *Vines and Vine Culture*, tells us that it was first brought into notice in this country by the late Mr. RIVERS, who received it from M. LEROY, of Angers. Subsequently (1861-1862?) Mr. STANDISH exhibited it at South Kensington, and now it is one, certainly not of the best, but the most popular Grapes for market purposes. There seems to be as much uncertainty as to its correct name as there is as to its origin. We have already mentioned M. MOREAU ROBERT, as the originator of this Grape, but this account does not tally with another version, according to which the Grape is of Caucasian origin. This source is mentioned briefly by Mr. BARRON, on the authority of Herr HOWATH, but as the statement is made with greater detail in the *Vigne Américaine*—a French publication not likely to be seen by many of our readers—we think it may be inter-

esting to many to give a summary of the account given by the editor, M. V. PULLIAT. In 1867, says this gentleman, Baron DE LONGUEIL, a Frenchman residing in the Caucasus, sent a large collection of Grape Vines to him. These all did well, and among them was a variety with large black berries sent from three different provinces of the Caucasus under the names of Dodrelabi, Sakoudrehala, and Madchanaouri. M. PULLIAT, finding all three alike, retained the easier name Dodrelabi. The following year M. PULLIAT ascertained that his Caucasian Dodrelabi was in all points absolutely similar to the (Gros Colmar of MOREAU ROBERT, and to the "Okorszem kek" (eye of the black ox) of Hungary. M. PULLIAT cites other synonyms under which the Grape is known in Hungary and Styria, but which we do not think it necessary to inflict upon the reader. There is a conflict of evidence here upon the merits of which we cannot pretend to pronounce an opinion; but it is clear, from what M. PULLIAT, says that he does not think himself in the wrong, while on the other hand, he has heard of such an occurrence as the diffusion of an old variety under a new name! But M. PULLIAT is evidently of a sceptical turn, for, alluding to some bunches of Mr. GOODACRE'S 16 inches long, by 6—8 inches across, he says he is too much accustomed to the puffery (*réclame*) of English Grapes to take such statements as literally correct. How often, says he, has he not received, under the most alluring recommendations, large-fruited English Muscats, alleged to surpass in beauty and flavour all that had been previously known, but which turned out to be nothing else but the old Muscat of Alexandria, which remains the best white Grape in cultivation.

It is curious to read this account of English advertisements. If it be as M. PULLIAT alleges, it must be taken as a set-off against the extremely rosy descriptions with which new French Roses are not infrequently heralded! But to revert to M. PULLIAT, we agree with the conclusions at which he arrives, and which are:—

1. That it is not easy to obtain from seed finer Grapes than the best of those we already possess.
2. That a new Grape announced to be a seedling should not be accepted as such if the raiser fail to give the history of the plant, and the names of the variety from which it was obtained.

Our own Royal Horticultural Society might, very properly, refrain from giving certificates to new varieties of any description without some such evidence, and wherever possible the novelty should be tried at Chiswick before any final award be made to it. In spite of what M. PULLIAT says, however, we should by no means like to discourage raisers of novelties. It may be true that in the case of a plant so long cultivated as the Vine it is very unlikely that a raiser will obtain anything absolutely better than already exists. But then the best variety is not of equal quality wherever it may be grown, and so there is always the chance of raising a variety better adapted to some particular conditions than any other. Take the case of Gros Colmar as an illustration. To our thinking, it is a very inferior Grape, but that is a matter of opinion. The extent to which it is grown by hard-headed cultivators, who assuredly know their own business, proves that it has valuable qualities. It is a case of "survival of the fittest," not assuredly in any absolute sense, but relatively. Thus, for market purposes, it is the fittest at a particular season, and so it is grown when better Grapes are neglected. Now, a market Grape must be productive, its fruit handsome, and calculated to travel well, and to

keep a long time. All these points Gros Colmar has, and hence the explanation of a second-class Grape holding the first place in the market. We may add that the largest single berry of this variety we have seen measured 4 inches in circumference.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are requested to ask those who have undertaken to fill up collecting cards to send them in to the Secretary, Mr. E. R. CUTLER, 50, Parliament Street, without delay, in order that the amount may be announced at the Anniversary Festival on July 4, under the chairmanship of the Right Hon. JOSEPH CHAMBERLAIN, M.P.

COMING ROSE SHOWS.—The following dates are given by Mr. MAWLEY, in addition to those published in our issue for June 9:—Alexandra Palace, Wednesday, June 27; Maidstone, Friday, June 29; Colchester, Saturday, June 30; Eltham, Saturday, July 14; and Cristleton, Monday, July 16.

HYBRID TACSONIA ANDERSONI ×. — Mr. J SMYTHE, gardener, Basing Park, obligingly sends us specimens of the Tacsonia raised by him between T. insignis and T. Volkemii. We gave illustrations of this remarkable Tacsonia in 1887, showing the stamens partially converted into petals. The leaves, moreover, are intermediate between those of the two parents, some being entire, as in insignis; others variously lobed, as in Volkemii. The Tacsonia is of a very rich colour. It is singular that Mr. R. ANDERSON, of the Gardens, Sowerby House, Hull, to whom we were indebted for our first knowledge of the magnificent T. insignis, described and figured in these columns, should have as long ago as 1874 raised the same hybrid (see *Gardeners' Chronicle*, August 7, 1875). On that occasion we suggested the name Tacsonia Andersoni × as an appropriate one. An illustration is given in the *Gardening World* of June 16, which shows the petaloid stamens, but the history of the hybrid and its first production by Mr. ANDERSON are omitted.

CHEADLE FLORAL AND HORTICULTURAL SOCIETY.—We note in the schedule of the above Society, that large money prizes will be awarded at the forthcoming show, on August 17 and 18, for fifteen stove and greenhouse plants. Some close competition will most probably ensue, and numerous creditable specimens be staged.

CHAMBRE SYNDICALE OF GHENT.—At the meeting of the above, held on Monday, June 11, in the Casino, the following Certificates were awarded:—To Dracæna Desmetiana and Dracæna Comtesse de Kerchove, by M. Desmet-Duvivier; to Nidularium argenteum striatum and Lomaria platyptera, by M. Aug. Van Geert; to Cattleya Reineckiana, Lælia species and Cattleya Mossiæ alba, by M. James Bray; to Cyripedium Mastersianum, by M. A. Peeters, Brussels; to Cattleya Schroderi and Cyripedium Boxalli atratum superbum, by M. Jules Hye-Leysen; to Cyripedium Godefroyæ bellatulum and Anthurium Andreamum Madame Ed. Pynert, by MM. Jacob Makoy & Co., Liège; to Thuia Lobbi aurea, by Alex. Dallièrè; and to Odontoglossum crispum and Cattleya Mossiæ de Puydti, by MM. Vervæet & Co.

MESSRS. J. WATERER'S SHOW OF RHODODENDRONS.—The usual annual display of these plants made by the above firm, at Cadogan Place, Sloan Street, is quite equal to any previous one held there; the arrangement of the beds under the large tent is the same, and the novelties of the year, which are always to be found there, are in some instances improvements, or at any rate deviations from ordinary colours and form of truss. In the novelties were some flowers with a very dark spotted patch on the upper segment of the flower. These form a distinct class, and are generally admired; we can name only one—the Earl of

THE PHOTOGRAPHED BY ...

Mr W.S. Kimball's Water Lily House, Rochester, U.S.A.

Powerscourt. Others have light purple, light cerise, crimson, and white flowers. Good flowered specimens were noted of Countess of Headfort, lilac-rose, spotted; Blandyanum, fine, rosy-crimson; Bertram Woodhouse, bright crimson, with light centre; Countess of Tankerville, clear rose; Duchess of Connaught, white, with primrose markings; Duke of Connaught, rosy-crimson; John H. Agnew, pale blush, with chocolate spots; Lady Howe, rose coloured, with a cone-formed truss—a form of truss destined to be much *en vogue*. It is needless to say that the show in the tent was gorgeous with colour, and should be seen by admirers of the flower who may chance to be in town during the next fortnight. The show of Rhododendrons made in the Row in Hyde Park has been very fine up to the present time, and consists of older varieties in large and small specimens.

FAGUS PURPUREA ROSEO-MARGINATA.—Notwithstanding the above name, this is simply a Copper Beech, whose leaf is edged with pink. It is very pretty whilst young, but the foliage will later in the summer assume more nearly the colouring of the type, still it is desirable as a variety. As a hedge plant in a garden, clipped twice or thrice during the summer, so as to get several crops of young shoots, it would prove very attractive. It was sent out by Messrs. T. CRIPPS & SON, Tunbridge Wells.

PLANTING THE DUNES.—From Calais to Hamburgh is a long stretch, but for nearly the whole distance the coast-line consists of loose sand, now forming flat "links" with a sparse but botanically very interesting vegetation, now blown up into picturesque, irregular hillocks, held together more or less, by creeping grasses and other plants. In some parts of Kent, in Suffolk and Lincolnshire, the same conditions prevail, but on a smaller scale. However pictorial, or however interesting to the naturalist, such land is, agriculturally, mostly a sterile waste, and it is therefore with no surprise that we learn that the King of the BELGIANS has interested himself in the matter, and has appointed a commission to study the best means of planting the dunes. We are the less surprised at His Majesty's interest in the matter, as some years ago we were eye-witnesses to the process of digging out His Majesty's villa at Ostend from the sand which had accumulated during the winter above the level of the ground-floor windows. The plans for the planting the sand-hills between Ostend and Blankenberghe have been executed by M. VAN DER SWAELMEN, of Brussels. They are so contrived as to insure protection from the prevailing winds, and when carried out will ultimately form picturesque woods with winding paths, good roads, and other conveniences, which will ensure not only an increased agricultural value to the land, but, what is now-a-days the most paying of all crops, a crop of villas facing the sea. Those who remember the delightful wood which extends from the Hague to Scheveningen will rejoice that there is now so good a chance of the formation of a similar wood between Ostend and Blankenberghe, a distance of 6–7 miles. So far as we are able to judge, M. VAN DER SWAELMEN'S plans are admirably adapted to the desired end.

TOBACCO, ENGLISH GROWN.—We received recently some Tobacco cut very finely, and in appearance resembling silky Virginian shag from the Tobacco works of Messrs. COPE BROTHERS & Co. (Limited), Liverpool. The "weed," which was made from plants grown on Messrs. CARTER & Co.'s land at Bromley, in Kent, was smoked in the form of cigarettes, and in a pipe, and was found to be destitute of the agreeable aroma of good foreign Tobacco, and burnt in the pipe unsatisfactorily. It should be mentioned that Messrs. CARTER demur to this being considered a fair sample, as it had not undergone the last processes in the preparation.

"FAMILIAR TREES."—Professor BOULDER continues his pleasantly written and accurate account

of the hardy trees met with in Britain. The woodcuts are good, and the same may be said of some of the coloured plates.

STATE AGRICULTURAL COLLEGE, IOWA.—The *Bulletin* of the Botanical Department is very interesting as showing what may be done in teaching practical botany to a class presumably of intending agriculturists. The tuition is essentially practical and a large share of the work is bestowed upon observations and experiments. How many of our gardeners, we wonder, have any knowledge of the peculiarities of the germination in Cucumbers and Melons; and of the few that have, how many would realise their practical importance, or be able to give a reason for the fact that such seeds germinate best if placed flat on the soil, not thrust in endwise or edgewise.

THE NEW POTATO CROPS AT PENZANCE.—The *Cornish Telegraph* of Thursday last (June 14) has the following note:—"Judging from the number of men to be seen wending their way to Gulval and Marazion, the work of raising new Potatoes in this neighbourhood commenced in real earnest on Monday. So far, we have not heard of any signs of disease among the Potatoes, which have made great progress towards maturity, thanks to the recent genial and welcome showers. Our Scilly correspondent writes: About 200 tons and 200 baskets were shipped from St. Mary's during the past week. The late rain has been a great blessing to the farmers here, and the islands are now looking fresh and smiling. The current price for Cornish 'ware' is 23s. per bushel of 24 gallons, for the first three days of the week. Prices bid for low ranges, owing to the lateness of the season, and the fact that Jersey, Scilly, and Cornish Kidneys are three competitors in the market at one time. Scilly ordinarily takes the lead, followed by the Cornish, with Jersey in the rear, but the lateness of the season has changed the aspect of things."

CHANGES IN THE SEED TRADE.—One somewhat singular trade development of our times is illustrated by the change that is taking place in reference to many of our wholesale seed houses in London. Looking back upon the past twenty years, it is instructive to notice how the processes of extinction and absorption have gone on. One of the oldest establishments, that of Messrs. BECK, HENDERSON & CHILD, was some years ago absorbed by Messrs. WAITE & Co., of Southwark Street. Later on the old firm of Messrs. MINIER, NASH & NASH also merged itself into Messrs. WAITE, NASH & Co. Two or three years since what was formerly Messrs. NOBLE, COOPER & BOLTON, of Fleet Street, and latterly Messrs. TABER & Co., of Witham, Essex, joined themselves to Messrs. COOPER & Co.; and now this last-named firm is absorbing that of Messrs. WAITE, NASH & Co., and that of Messrs. HENRY CLARKE & SONS, of King Street, Covent Garden, under the title of Messrs. COOPER, TABER & Company (Limited). We can only speculate upon the causes of these changes. If they mean a decreased volume of trade all round, it is matter for sincere regret. There are, no doubt, substantial and satisfactory reasons for the changes. They have gone on in another direction; for we have seen the once famed Wellington Road nurseries, St. John's Wood, disappear, and the equally famous Pine-apple Place Nursery has become absorbed into the business of Messrs. HOOPER & Co. (Limited), Covent Garden Market. The two firms of GUNS & Co., of Piccadilly, are now one; and in the provinces, the rival firms of Messrs. JAMES DICKSON & SONS, and Messrs. F. and A. DICKSON & SONS, of Chester, are amalgamating. At Birmingham the firm of Messrs. R. H. VERTREANS & Co., is absorbing those of Mr. HANS NIEMAND, and also of Messrs. THOMAS HEWITT & Co., of Solihull, to be known hereafter as a limited liability company, as was mentioned in our columns recently. And so the world wags in matters horticultural.

CHIPPENHAM HORTICULTURAL SOCIETY.—As a means toward the reinvigoration of the above languishing Society, special prizes for Dablias, ranging from £3 to £5, are offered for competition at the show to be held on August 14 next. Much credit is due in this matter to Mr. G. HUMPHRIES, of Kington Langley, and Mr. HEREMANS, Jun., of Langley Burrell.

HYBRID BEGONIA.—Messrs. SUTTON & SONS, of Reading, claim to have succeeded in obtaining a distinct cross between a tuberous-rooted Begonia and one of the B. Rex type. In this case the shape of the leaf of the tuberous-rooted type is preserved, but they are distinctly marked with spots of pale grey, which it may be supposed comes from the Rex parentage. By and bye we shall have an opportunity of seeing it in bloom. It has a close, compact, and at the same time free habit of growth, and it is expected to make a good bedder. If it does, it will be an excellent companion to their Princess Beatrice, one of the best bedding Begonias yet sent out.

ROYAL BOTANIC SOCIETY OF LONDON.—The Council of the Royal Botanic Society in communicating with the Secretary of the National Co-operative Flower Show states "that although it does not come within the province of the Society to offer or award medals or prizes other than at its own exhibitions, and [although it] has never done so, yet in consideration of the special features of your National Festival and Exhibition, the Society will be pleased to add one of its Large Bronze Medals to your list of prizes." We understand that the medal will be offered for the best collection of botanical specimens.

NEW PELARGONIUM DUCHESS OF TECK.—We have received from Messrs. FISHER, SON & SIDRAY, nurserymen, Sheffield, a beautiful white form of "regal decorative" Pelargonium. The trusses are large, the flowers of the purest white, and of good substance. The plant is said to be of a compact habit, and it will certainly prove of value for cutting and other purposes.

BOTANICAL DRYING PAPER.—Messrs. WEST, NEWMAN & Co. send us specimens of their paper for drying Ferns, flowers, &c. The reputation of this paper has not to be made; it has long been established, but Messrs. WEST, NEWMAN & Co., have also introduced a modification in the form of a thicker paper, which can be used to form the "dryers," as used by the American botanists. Those who have occasion to dry plants will find this paper a great boon.

THE LATE BATH AND WEST OF ENGLAND SHOW.—Some excellent plants from the garden of Mr. CAPEL HANBURY, Pontypool Park, Monmouthshire (Mr. J. LOCKYER, gardener), were inadvertently omitted by our reporter. These consisted of a fine *Davallia Mooreana*; also *Alsophila excelsa* in fine condition; two fresh specimens of *Clerodendron Balfourianum*; a large plant of *Cypripedium barbatum*; and a well-furnished specimen of *Cyanophyllum magnificum*—a plant seldom seen now in first-rate condition.

CURVES OF INQUIRY AND PLEASURE.—I have seen the remark that paths should be straight unless there was a reason for a *detour*, it being absurd for a man to have a winding path on a smooth lawn leading to his house. Who has not observed a footpath on a meadow, how it curves and counters? Often the cause is to be found in some stone or bush, but in many cases there is no apparent reason. To my mind, the cause can be found on some higher plane than the ground. If a large tree attract attention, and the slight curve made in inspecting it—we naturally follow our eyes—opens up another view, the path is made to curve and open up a pleasant panorama. So a path leading to a house, made by daily use, had better be followed out in remodelling a lawn garden. There is enough straight walking in the city; so let the path grow, and fix it over when it is well marked out by daily use. Then fill the turns of this path with trees or flower-beds, which will explain to careless eyes the immediate reason for the curves.

TUBULAR FLOWER-HOLDERS.

MESSRS. GEORGE SMITH & Co. have sent us a specimen of a device for displaying cut flowers. The flower-holders fig. 107 are solid discs in the shape of a dome, either round or oval, with a flat base, in which are sunk forty to fifty tubular orifices gradually inclining outwards from the centre. When flowers are to be arranged, the tubes are filled with water, and the disc is placed on an ornamental plate of wide diameter (preferably of glass or terra-cotta), which retains any overflow of water, and supports the outer leaves. The sprays of flowers and foliage are inserted in the tubes one by one according to the taste of the arranger—the highest in the centre; others inclining outwards, and the lowest resting on the margin of the plate.

Each spray remains exactly where it is placed, and the effect of the grouping can be studied as the work proceeds. Ferns and other graceful foliage play a great part in this mode of decoration, dividing one flower from another, and entirely concealing the mechanism of the contrivance.

This new system of flower arrangement is specially recommended for the use of ladies, who will be able by its means to produce a great variety of beautiful effects in the whole field of decoration. It will also afford great facility to attendants, when ladies are unable to give personal attention.

One caution we must give to those who use this contrivance, and that is to introduce sufficient Fern, Asparagus, or other light foliage to break up the formality of the arrangement, which otherwise is apt to be too evident.

HOME CORRESPONDENCE.

INSECTS.—In seasons like the present these increase and multiply at a very rapid rate, and more particularly is it so as regards aphid, grub, and other garden pests. This is at once seen in the case of Peaches and Nectarines, which are very susceptible to greenfly, but, by timely attention, these may easily be got rid of, as there are many ways of killing such insects, one of the readiest of which is by the aid of tobacco-powder, which may quickly be dusted over the affected parts. After it has been on a few hours it ought to be washed off by giving the trees a good syringing or sousing with the garden-engine, and the same if any other insecticide is used. Another speedy way of destroying aphid is to boil some Quassia chips in a copper, and while the water is hot, to dissolve some soft-soap in it; it is very potent, and safe to apply. The strength at which the liquid may be made is about 1 lb. of Quassia, and the same weight of soft-soap to 5 gallons of water, and if used warm its action is more certain, as then it quickly penetrates the shiny, almost impervious coats of the insects. Unless the trees have been allowed to get much infested, it is better not to syringe the stuff on, but to

dip each shoot separately, but do not dip the fruit, as it may injure the delicate skin, and more especially that of Peaches. To keep off red-spider from Peaches and Nectarines there is nothing equal to clean cold water, which, during hot sunny weather, should be applied every evening by means of a good engine, but the stream should be broken in such a way as not to injure the leaves. One of the chief causes of the appearance of the last insect referred to is dryness in the air and at the roots of the trees as well; for, though we may get a fair amount of rain, Peaches and Nectarines against high walls and on raised sloping borders very seldom receive their due share. This in all cases ought to be provided against by timely mulching and the application of water, so as to give at least one thorough soaking when the fruit is swelling, as at that particular time there are great demands on the roots. Carrants, like other things, are also showing bad symptoms of fly; but as the fly is mostly on the points of the young growth, they need cause but very little trouble, as the ends of the wood may quickly be removed by snipping them off with a knife and popping them into a basket, when they should be carried away and buried or burned. If the bushes are attended to at once and treated in the way mentioned, the fruit will be saved from that disfigurement which is so often seen, as when the insects are left on long the excreta they exude falls in such quantity as to coat the berries and bunches, and spoil them for use. J. S. [With regard to the insects infesting the Apples, Pears, Roses, and other plants this season, it is to be feared we gardeners have not as yet mastered their life-history, and do not know how to deal with them effectively. The syringe, lime, and soot, and the other so-called remedies are useless, or nearly so. We must begin in the autumn and winter with our defensive remedies, destroy the eggs, webs, chrysalids, which abound in the bark, the soil around the trees, on the bark of other trees, and on fences, by scrubbing the bark, baroing the soil in heaps, digging to expose the under parts of the crust to the frost and to the attention of the hungry birds, by dressing with gas-lime, soot, lime. If these operations were carried out always wherever there had been an attack from the Gooseberry-caterpillar, the Apple-moth, American blight, and many other gardeners' foes, the results would be such that no gardener would leave them undone in the future, provided his resources in labour and material are what they should be. Let every man who has a garden study Miss Ormerod's *Injurious Insects*, and thereby save valuable fruit and vegetables, and his employers' pocket at the same time. Ea.]

THE PLAGUE OF MAGGOTS AND CATERPILLARS ON APPLES.—From whence they came or whether they are going, unless utterly to devour our trees, I cannot certainly tell; but that they are or have been here with an enormous destructive force and in incredible number seems certain from the havoc they have worked among our Apple leaves and fruit the enclosed fair sample of their doings will show. But the rapidity and semi-invisibility of their work is almost as marvellous as its completeness. It is hardly an exaggeration to say that we have hardly a perfect leaf left in the garden or orchard. The majority of the trees look as if they had stood in a direct line of a full charge of grape or other shot. They are riddled and riven into all forms and in all directions. But notwithstanding this the number of maggots and caterpillars captured bears a beggarly proportion to the work of destruction. They have begun, continued, and virtually ended their work of destruction with amazing rapidity, virtually unseen, and with the most rigid impartiality. Some large trees, the relics of an ancient orchard in the pleasure ground, seem equally hard hit, with the pyramids and cordons of different forms and that constitute the bulk of our Apple trees. So far as I can see not one form of tree nor a single variety has escaped the plague of maggots or of caterpillars. This is the more singular as we have never been seriously tried with either pest before. Hence it is probably a legacy or penalty of the intense heat and drought of the summer of 1887. Being scarce of water we were not able to spare any for our Apples which, however, ripened a very fair crop, and ripened their wood pretty well without showing much distress under the intense heat and drought. Growth, however, was considerably arrested as well as shortened, with the somewhat unique result that it scarcely reached its normal vigour or maturity before the end of the growing season. Hence I was not greatly

surprised when the spring revealed a paucity of blossoms on many of our Apple trees; and not a few of our cordons that have not failed before, since they were weighted with fruit at two years or less, were bloomless this spring. The lack of colour in Apple blossom has also been a notable feature of the spring in this district, and proved the sure and certain harbinger of coming failure—coming events thus casting their pale shadows before. Can the Editor or the many experienced fruit growers that read the *Gardeners' Chronicle* throw any light upon the probable causes or cure of this tolerably rare and certain sign of coming disaster? Nor can this lack of colour in Apple-blossom have any possible connection with the plague of maggot. Thus, assuming that the colouring of the flowers of fruit may be the last finishing touches of vital force and growing power, would not the lack of colour reveal the presence of debility? If so, we know we are sure that debility, either of force or of motion, opens out the very citadel of life to the inroad of insect or other pest, and all sorts of enemies and diseases. If, therefore, I might venture to assign a cause for the unprecedented energy and force of the pest of maggots this spring, it would be that the heat and the drought of last summer somewhat disarranged the functions of their, on the whole, temperate climate, and enfeebled their health, and the maggots and caterpillars failing such masses of vegetable food then specially fitted for their use, have made haste to devour its leaf shootlets and fruitlets. By commencing operations in the crown of the buds of course all the leaves were torn and riven before they were opened, and hence mostly the ragged look of the trees, and also the practical difficulty of finding a proportional number of grubs or caterpillars at work in proportion to the enormous wreck and ruin accomplished. Of course there are other explanations that might be given as to the abnormal plague of Apple maggots this year; as, for example, the unusual stimulus afforded to the grubs and moths through the unusual heat and drought of last summer; but the conditions must meet together before such wholesale destruction can be accomplished, viz., the presence of the destroyer and the presence of the juices or substance of vegetation in such a state as shall tempt and sustain their rapacity. It is in this latter direction that the weakness or disease of plants work with insect pests to compass their injury or destruction. D. T. F.

BLIND NARCISSUS POETICUS.—In the hope of elucidating the mystery which seems to surround the common production of blind flowers by the Poet's Narcissus, I conferred with one of our largest local growers of these flowers, and found that he had ample experience of this too common defect. It is, perhaps, more marked amongst doubles than singles, but seems to be more a feature of the poetical strain than of others. My neighbour informed me that at least one-half of his doubles threw blind flowers this year, and he attributes the malady to low night temperature, just at the moment that the buds burst through the soil. Just then, and after being for several days developing and pushing through the soil in a semi-blanching state, of course the flower-buds are exceedingly tender, and the least frost, in his belief, suffices to destroy the flowers. Of course that is a purely theoretical opinion, and may not be the right one. He remarked that one of the best batches of bloom he ever had were from a lot of bulbs buried deeper than usual, because some soil from a cutting made to draw off water from the land was spread over the bed after the bulbs were planted; that kept blooms later than usual, and thus are assumed to have escaped late spring frosts. He proposes to test another year the value of some sort of protection in the shape of a mulch of litter, through which the bloom-sheaths must take two or three days in pushing, and thus gradually harden; or else to plant the bulbs in double rows close together, with intervals of some 18 inches or 2 feet between each such double row, and to cast up before the leaves appear a ridge of light loose soil over them. Of course the benefits from either course are uncertain, but no remedy can be hoped for unless sought for and tested. Naturally it may be assumed that if the late blooming poetical forms suffer in this way from frosts the earlier blooming varieties of other sections of the family of Narcissus should suffer even more. That does not, however, appear to be the case, and if it be not so then it seems obvious that the late bloomers are naturally the most tender, assuming, of course, that the theory put forth as to the effects of late frosts on the buds is the correct one. Possibly something may

be due to the nature of the preceding season and its effect upon the bulbs. Late bloomers must of necessity be late ripeners, and it may be that sometimes, perhaps often, heat and drought check growth too early, and the bulbs are not sufficiently matured to produce fully developed flowers. Most of these bulbs like ample warmth to ripen them, but they like good soil and amply moisture at the proper time to mature them also. *A. D.*

— It does not seem to be clear what the cause of this is. It would, however, appear to be due mostly to shallow planting and warm situations. In the colder North blindness in this flower usually occurs—only so far as my experience goes—when the bulbs, originally planted rather deeply to be safe from the hard frosts of that part of the island, have been forced upwards by constant additions of new bulbs, the shallowness being aggravated by the removal of the surface soil by cleaning. The evil

the surface, which none but the hardiest species are able to withstand. An example of this was seen in the display of Crocus last winter, when shallow-planted corms bloomed bravely at an early date, only to be spoiled by severe frosts long before their natural duration of bloom was at an end: deeper planting would have saved them. *M. W.*

— The behaviour of this flower here is very curious. I have a large number of bulbs of the single form in a border in my garden which every year bloom splendidly. Some years ago a few bulbs from this very border, and of the same stock I am now flowering so well, were removed to my brother's garden, which consists of the same kind of soil as mine, and is only divided from it by the roadway, yet these invariably go blind. For the first year or two they matured their flowers, but now the flower-buds never open. Last season the bulbs were lifted and

being abundant croppers. The seeds are very small and dark. *W. Smythe, The Gardens, Basing Park, Alton, Hants.*

MULBERRY PRODUCING MALE FLOWERS.— Nearly twenty years ago I planted a young Mulberry for my present employer. It was well treated in good maiden loam, and it produced, after a year or two, good crops for, say, ten years. We looked for another good crop the following year, when, to our disappointment, it bore almost exclusively male bloom-spikes of which it produced, I may say, many thousands, but hardly any fruit. Since then it has been root-pruned, and two years later we commenced feeding it alternately with water and with liquid manure. The result is, that it has borne a little more fruit, which grows in groups at the ends of a few of the smaller boughs. But, speaking in a general sense, I can only report that the tree is now again covered with many thousands of the unprofitable and unwelcome catkins. If you saw the tree I think that you would, from its foliage, judge it to be in excellent health. I need hardly trouble you by adding that I shall be grateful for any practical suggestions of a remedy. I enclose cuttings. *Blackheath.* [It is not unusual for the Mulberry and other bi-sexual flowering plants to produce, under certain climatal conditions which are not under our control, male flowers only. You seem to have done the right things by root-pruning and manuring the tree. *Ed.*]

PICKING SEED-PODS FROM RHODODENDRONS.— Although the picking of seed-pods from Rhododendrons is a work of time where many are grown, yet nothing, perhaps, pays better for the doing than relieving the plants of the seed-vessels, for if these are left on and no heavy rains happen to fall the plants make but little growth, and are, therefore, unable to form many flower-buds. It is necessary to be careful in removing the bunches of seed-pods, which snap off readily if taken whilst they are still young. Rhododendrons are assisted very much to set their flower-buds by good waterings, the soil being mulched after the first of these, to keep the roots moist by preventing too rapid evaporation. *J. S.*

PRIMULA RETICULATA.— It is always a matter of regret when the name of new or rare plants is wrongly applied, and spurious plants circulated, as it often takes years to undo the errors of a season. This has been so with a variety of *Polemonium coraleum*, which still does duty in nurseries for *P. Richardsoni*, which it does not resemble. We are now in the same danger with regard to *Primula reticulata*, for which forms of *P. sikkimensis* are in common circulation—one firm describes it "as more amenable to cultivation than *P. sikkimensis*, and somewhat taller growing." This is not so. I distributed twenty plants of *P. reticulata* last summer amongst skilful gardeners, and I am afraid only four or five remain alive, and those weakly. The true *reticulata* is much slenderer and smaller in all its parts than *sikkimensis*; the flowers, besides being much smaller, are fewer, and more nearly white; but an unfailling distinction from *sikkimensis* is found in the leaf, which on a long slender petiole always has a distinctly cordate base, while *sikkimensis* never has this form. *C. Wolley Dod, Edge Hall, Malpas.*

THE STRAWBERRY PROMISE.— Whilst complaints are rife as to the considerable number of blind plants seen this year—due, without doubt, to last year's drought—yet is the bloom fine and abundant on those plants which are not blind. The recent general heavy rains have come at a most favourable time for the plants, and have helped to set the bloom admirably. Where mulching has not been done it is now being carried out rapidly, but those who did this work earlier have the satisfaction of seeing the litter well washed. If the drippy weather should continue for another week, a really good crop of fruit, because a fine sample, will be ensured. Generally, frosts have done no harm to the bloom, so that the earliest flowers have set well. There does not promise to be any great abundance of outdoor ripe fruits before the end of the month, but much depends upon the situation. *A. D.*

DISEASE OF ORNITHOGALUM.— The note on *Heterosporium Ornithogali* on pp. 658-9, May 26, is very interesting. *Ornithogalum umbellatum* is one of the most abundant plants in my neighbourhood, and almost every clump in the district is attacked by a fungus apparently identical with your correspondent's.

FIG. 107.—TUBULAR FLOWER HOLDER. (SEE P. 780.)

due to shallow planting, and of the bulbs becoming slightly buried, in the lapse of time, when bulbs are not replanted every two or three years, seems to point to cold having something to do with the failure to bloom properly. The influence of cold in this way may be obviated by deep planting—7 to 9 inches, according to size of bulb; or by piling coal ashes, cocoa-nut fibre, or leaf-soil, over the sites of the bulbs to the depth of 6 inches. As a rule, the planting of bulbs of all kinds is made at too shallow a depth. I know of late Tulips in flower-beds, which were planted at such a depth, that digging with the spade could be carried out in the autumn without disturbing the bulbs. These always flowered well in May, and were but little later than those planted much less deep. Of course, shallow planting, when it is not done from ignorance of results, is carried out with the idea of getting early bloom from the bulbs, and were our winters of a constant character, it would always be followed by the looked-for results; but the variable weather experienced, with sometimes summer warmth in mid-winter, has an exciting effect on bulbs at 3 or 4 inches beneath

the soil manured, but the result this year is precisely the same. *D. J. To.*

THE FERTILISATION OF SCARLET RUNNERS AND FRENCH BEANS.— I may inform "A. D." (see p. 755) that I have been most successful, and made many changes both in the Scarlet Runner and also in the French Bean by fertilisation, and have had many coloured flowers from the Scarlet Runner crossed with the French Bean, *Ne Plus Ultra*. The flowers on some were scarlet and also various, like the Scarlet Runner, and the plants only 18 inches high; others had white, and creamy-white, and scarlet flowers. The bean-pods were like those of the Scarlet Runner, and also the leaves; the seeds were smaller than those of the Scarlet Runner, but much larger than the French Beans, and darker in colour than either of the parents—midway between the two. I also fertilised *Ne Plus Ultra* with Canadian Wonder French Bean, and I got a fine improvement—the plants 3 inches higher than *Ne Plus Ultra*, but much shorter than Canadian Wonder; the pod is longer and wider, and of a beautiful green, besides

Moreover, clumps of *O. nutans*, growing in the midst of its infected relatives, are perfectly free from disease up to the present date. The plants which are attacked seem prostrated beyond recall; they have a carbonised, baked appearance. When touched clouds of spores fall to the ground, and blacken it perceptibly. *W. Cross, Lytham.*

GLADIOLUS THE BRIDE.—Everyone having a garden or greenhouse to furnish with flowering plants or rooms to supply with cut flowers should grow this excellent free-flowering *Gladiolus*. Just now (the middle of June) there is a grand display of it in the conservatory attached to Clovelly Court, the charming residence of the Misses Hamlyn Fane, on the North Devon coast. Three or four bulbs were planted last March in a 6-inch pot, of which about 200 were so filled, using a mixture of three parts of the rich Devon loam of which the kitchen garden consists, and of short well-decomposed manure and sweet leaf-mould. The pots were then placed in an orchard-house and brought gradually on, transferring the plants to the pretty conservatory as soon as they came into flower. There are also several rows of the same *Gladiolus* in the kitchen garden, which, in a month or five weeks, will also render a good account of themselves. The village of Clovelly, I may say, is situate on the face of a steep and lofty cliff in a bay 11 miles from Bideford, 20 miles north-east from Ilfracombe, and 15 miles from Lundy Island. *H. W. Ward.*

COLOURED POTATOS.—On reading "A. D.'s" note on Rufus Potato, in your issue for June 9, p. 728, I find that he makes mention of the Vicar of Laleham as being perhaps the most popular of all coloured varieties. In support of "A. D.'s" statement I would remark that I have grown Vicar of Laleham for eight years, and I have, moreover, twenty different varieties of Potatoes, and amongst them six coloured well known varieties; but I always considered Vicar of Laleham by far the best of the late ones, either wholly or partly coloured. Seeing that the parents of Rufus are both good growers and of superior quality, and which are extensively grown in this part of Lincolnshire, should like to know where Rufus can be obtained at the proper season. I may remark that I am making a trial of a new Potato called The Daniel; it is a cross between the well-known varieties Magnum Bonum and White Elephant, and to-day (June 12) the plants are in flower, and look like turning out well. They have splendid tops, and every set came up well. *F. Grant, Epworth.*

THE LATE MR. THOMAS JACKSON.—A very wide circle of Chrysanthemum growers will have learnt from your pages of last week with exceeding sorrow of the death of Mr. T. Jackson, of Kingston. That esteemed nurseryman had been for many years the secretary of the Kingston Chrysanthemum Society—really the premier Chrysanthemum Society of the South, until the National Society sprang into existence and carried off the honours. But all who from year to year at Kingston were brought into contact with Mr. Jackson readily acknowledge his quiet unassuming disposition, his affable demeanour, his admirable capacity to arrange his shows and perform his work without fussiness and in the most admirable way. He seemed to be always of a peculiarly retiring disposition—perhaps to some extent from innate physical disability. It would be, indeed, a graceful act on the part of the committee of the Kingston show were they to establish a special Jackson Memorial Medal or Cup class for Chrysanthemums as a pleasant reminder of one to whom the show at Kingston and the growers of Chrysanthemums owe so much. It is but right mention should here be made of the very efficient help always given to the late secretary by his excellent foreman—Mr. Puttick. *A. D.*

REPOTTING LILIES.—I can assure Mr. Ward I had no intention whatever of making extreme statements, much less of departing from well established facts, nor, indeed, have I done so; and while Mr. Ward accuses me of so doing, he fails to prove it by the argument he adduces at p. 754. I am well aware that many gardeners find it extremely difficult to attempt a departure from the stereotyped laws of plant culture as practised years ago; yet we have only to look into Covent Garden Market to see the great advance which departures from the old ways have brought about in plant growing and witness the success attendant thereon. When I read Mr. Ward's advocacy to shake the old soil from the

roots of Lilies in the first week in May, I considered his advice sufficiently random to require a challenge. Your correspondent now desires to substitute the word "loose" for "old," as originally supplied, but this will not meet the case; seeing that Mr. Ward distinctly recommends immediately afterwards that the soil must be "worked well among the roots." From this statement it is clear that Mr. Ward either anticipated giving his plants a good shift, or shaking off a good deal of the old soil, to allow of the new being "worked well among the roots." Nothing having been said at p. 558 about potting into larger pots, I could only draw one natural conclusion—viz., that the plants had to be returned into similar sized pots again, and to do this a considerable portion of the old soil must necessarily be removed. Moreover, these conclusions are supported by Mr. Ward's statement at p. 754, where he gives his *modus operandi* of shifting into larger pots. Your correspondent suggests that "I would prefer potting them when they have made a few inches of growth to the time when the flower-buds are first visible;" but with neither method will I have anything to do. The supplying of bulbous plants such as these with suitable food should be done at the right moment, and I contend that all bulbs which put forth new basal roots annually should be potted immediately preceding their issuing from the bulbs, which invariably in *Lilium* follows closely upon the maturation and decay of the current flowering stems. Beyond this, there is this decided advantage to be gained by the autumn potting of Lilies, and which cannot be performed in May with the new flower-stem present. All who grow Lilies in pots to any extent are aware of the great mass of stem-roots which are formed upon the flower-stem. In many Lilies, particularly auratum varieties, these roots come in sufficient number to exhaust the soil down to the very apex of the bulbs; the removal of this soil, and supplying fresh in its stead, is a matter of annual importance, and can only be done thoroughly by the removal of the old stem, either by cutting it off close to the bulb, or carefully removing from the bulb itself, which may be readily done when the stems are decayed, a slight twist being all that is necessary. This new supply of food must be of great help to the stem-roots, as they issue forth in such numbers. Mr. Ward, however, appears content to forego this advantage, and prefers that the new stem-roots shall feed on the exhausted soil and old roots of the last season rather than give his plants proper food at the right moment: and what I consider the right moment is the time when potting may be performed without interference with coming roots, for have we not to depend upon these for the best results?—and can this be expected if the plants, roots and all—are tampered with in full growth? Lilies which require shading after repotting have been unnecessarily disturbed at the root, hence checked, therefore suffer in a corresponding degree. *E. Jenkins.* [Notwithstanding our correspondent's censure of Mr. Ward's methods, his Lilies are admirable specimens of cultivation. *Eo.*]

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

TUESDAY, June 12.—Present: Professor Church, F.R.S., in the chair; and Messrs. A. D. Michael, G. Murray, J. O'Brien, H. N. Ridley, and Professor Scott.

Mr. Linden, Brussels, sent for exhibition a plant of *Dendrobium macrophyllum* var. *Bleichroderianum*, from New Guinea. A Botanical Certificate was proposed by Mr. O'Brien and seconded by Mr. H. N. Ridley.

Mr. J. Douglas exhibited a plant of an *Oncidium*, introduced with *Odontoglossum* triumphans. It was referred to Mr. Ridley for name.

Mr. Wolley Dod sent young leaves of a Weeping Ash which had turned black at the base of the petiole, and fallen off. He thought it might be due to drought, and the matter was referred to Mr. Murray and Mr. Michael. Mr. Wolley Dod also sent an abnormal flower of *Campanula Allioni* (Villars), with a double corolla, a sport of a typical plant.

The Hon. and Rev. J. T. Boscawen sent two Primroses with phylloidy of the calyx.

Mr. Ridley exhibited two flowers of *Catasetum macrocarpum*, from a plant obtained by him in Pernambuco, and flowered by Mr. Moore, of Glasnevin Gardens.

Mr. Veitch exhibited the flowers of a series of *Rhododendrons*, showing the effect of crossing with *R. Teysmannii*.

Lily Disease.—Mr. Murray, to whom specimens of diseased Lily stems were referred at the last meeting, reported that from fresh specimens sent him by Mr. Lewis Castle he had been able to determine the disease, which is caused by *Ovularia elliptica*, and an account of it by Rev. M. J. Berkeley may be found in the *Gardeners' Chronicle*, 1881, p. 340.

Gentiana acaulis Varieties.—Dr. Scott reported on the abnormal flowers of *Gentiana acaulis*, which had five spongy outgrowths on the corolla, corresponding in position to the petals. The microscopic structure showed that they were due to excessive superficial growth of the external tissues, especially the epidermis. The outgrowths showed large irregular intercellular spaces. At many places they had coalesced so as to form closed cavities lined by epidermis. When vascular bundles were present, the position of xylem and phloem was variable. The upper end of each outgrowth was flattened, and here the bundles, though generally concentric, showed an approximation of the xylem towards the upper surface. There was no evidence that these abnormalities were caused by insects, but if so, the regularity of the outgrowth shows that their attack must have taken place at an early age.

ROYAL BOTANIC.

JUNE 20.—The great summer show of the Royal Botanic Society was held on Wednesday last under most depressing circumstances, rain falling all day long, but notwithstanding this there was a fairly good attendance of visitors, and the tent was uncomfortably crowded. Fine specimen plants were wanting in the display, and the miscellaneous exhibits were a very important part of the show. Fruit was remarkably fine throughout.

In the competing classes Mr. H. James, Castle Nursery, Norwood, was the most generally successful competitor, securing 1st in several classes, among others for six fine-foliage plants, for six stove and greenhouse plants in flower; and again in the leading class for twelve ditto, and for *Sarracenia*, &c., having several very creditable specimens, especially of foliage plants. *Cycas revoluta*, *Dracaena Shepherdii* and *Latania borbonica*, shown in the class for six, were specially so. *Anthurium Scherzerianum*, *Dracophyllum gracile*, *Stephanotis floribunda*, *Clerodendron Balfourianum*, and a few *Ericas* were the best flowering examples.

Mr. J. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, was another very successful exhibitor, carrying off leading honours for six stove and greenhouse plants in flower, for six large specimen exotic Ferns, and for six fine-foliage plants (amateurs). He, however, was placed 2d to Mr. R. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan's, Regent's Park, N., for six specimen Palms, which were, however, excellent from both. Mr. Butler was himself 2d to Mr. Offer for Ferns and for fine-foliage plants. Of the plants shown by Mr. Offer the following may be noted:—*Clerodendron Balfourianum* (very good), and *Erica ventricosa coccinea* minor, *Croton Williamsii*, *C. Weismanni*, both very fine plants; *Phoenix reclinata*, *Latania borbonica*, *Thrinax elegans*, *Chamaerops humilis*, and *Dasyllirion acrotichum*. Of Ferns, *Thamnopteris nidus-avis* was a good plant, and so also were *Cyathea dealbata*, *Toodea africana*, and *Alsophila australis*. Mr. Butler had, of Palms, *Areca Baueri*, *Chamaerops exelsa*, *C. gracilis*, *Corypha australis*; and he had also *Pandanus Veitchii*, *Cycas revoluta*, and *Adiantum formosum*.

Of Orchids in competition there were some first-class groups. Mr. F. Hill, gr. to H. Little, Esq., The Barons, Twickenham; Mr. Jas. Cypher, nurseryman, Cheltenham; and Mr. H. James, divided the honours here.

Mr. Cypher showed a grand lot of plants in the class for twelve. *Epidendrum vitellinum majus*, *Dendrobium Falconeri*, and very large and freely-flowered pieces of *Cattleya Mossiae*, *C. Sanderiana*, &c., were the most conspicuous.

Mr. Hill, in the corresponding class for amateurs, had *Vanda teres*, *Cattleya Sanderiana*, *C. Mossiae*, *C. intricata*, and *Anguloa Clowesii*—all represented by fine pieces. For a group of *Dendrobiums* and *Cypripediums* the same exhibitors maintained the lead in their respective sections—*D. moschatum*, *D. suavissimum*, *D. Bensoniae*, *D. B. alba*, *D. Parishii*, *D. thyriformum*, being well represented; and of *Cypripediums*, *C. bellatulum*, *C. Stonei*, *C.*

biflorum, and C. Dominii. In Mr. Little's exhibit a fine piece of D. thyrsoiflorum, with large flowers, was conspicuous; D. Dalhousieanum, Cypripedium Dayanum, C. niveum, C. ciliolale, and C. Lawrenceanum, were to be seen.

Pelargoniums fell below the old Park standard, and they were limited in quantity also. Mr. Turner states that the June plants are very late this year, and this fact may have had something to do with their scarceness. In the nurseryman's class Mr. C. Turner, Royal Nursery, Slough, was the only exhibitor of six specimens, having nice medium-sized specimens of Maid of Honour, Despot, Prince Leopold, Volonté Nationale, Prince of Prussia, and Virgin Queen.

In the amateur's class for six plants there was a sharp tussle between Mr. F. J. Hill, gr. to H. Little, Esq., The Barons, Twickenham, and Mr. D. Phillips, gr. to R. W. Mann, Esq., Langley Broom, Slough, quality of flower giving the former the benefit, he being 1st with Hermit, Fortitude, Ruth Little, Duchess de Morny, Thebais, and Flirt. Mr. Phillips had in the main varieties of the decorative type, though his plants were taking in appearance and even in size; his varieties were—Lady Isabel, Gold Mine, Kingston Beauty, Amethyst, Triomphe de St. Maude, and Mauve Queen.

Mr. Turner was the only exhibitor of fancy Pelargoniums, being placed 1st, with Ellen Beck, extra fine; Cloth of Silver, East Lynne, Delicatum, The Shah, and Lady Carrington.

In the amateurs' class there was only Mr. Phillips' half-dozen—a creditable lot—the 1st prize being awarded to him for Delicatum, East Lynne, The Shah, Nelly Fordham, Mrs. Porter, and Lady Carrington.

The specimens of zonal Pelargoniums were a good feature, there being five competing collections of six plants. Mr. Hill was 1st, with freely grown and well flowered plants of Sophia Birken, saluon; Mrs. Gordon, scarlet; Jules Simon, and Aglaia, doubles; and two others. 2nd, Mr. D. Phillips, whose best plants were Octavia, Mrs. Gordon, Ceres, and P. Neill Fraser.

Tuberous rooted Begonias were seven entries for twelve plants, but one only was staged, that from Messrs. Henry Cannell & Sons, nurserymen, Swanley, representing the fine dwarf compact and free flowering strain produced there. They were admirably grown and finely bloomed, the doubles especially being a great feature. The single varieties consisted of Fairy, Mrs. Murphy, Countess of Bessborough, Thomas Moore, and Mrs. Edwards; the doubles, Felix Crousse, Madame Arnould, Mr. F. Wilson, Louis d'Or, M. Duvivier, and Gabrielle Legros. By the side of this collection was a dozen of new varieties of high quality, to which Certificates were awarded to be presently detailed.

Variogated-leaved Plants.—These were confined to stove plants mainly, Mr. C. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, being 1st with well grown and coloured specimens of Alocasia macrorrhiza variegata, Croton Morti, C. roseo-pictus, and C. Queen Victoria; Alocasia metallica and Pandanus Veitchii. 2nd, Mr. H. Eason, gr. to B. Noaker, Esq., Hope Cottage, Hlilgate, with Acalypha musaica, Dieffenbachia Baumanni, Pandanus Veitchii, and Croton Queen Victoria, being his best specimens.

Miscellaneous.—In this section were several noteworthy exhibits, that of Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, being of special interest. They showed a group consisting of a number of new and rare plants, securing several Certificates, under which heading they will be found mentioned. There were numerous hybrid Rhododendrons in full flower, and a quantity of ornamental Japanese Maples; other plants included Amorphophallus Rivieri, Daphniphyllum glaucescens, Epidendrum O'Brieni (see p. 770, of this issue); Begonia Arthur Malet, Rosa microphylla fol. var., Weigela rosea Loysmansii aurea, a pretty golden form; a golden Ligustrum vulgare, Eulalia japonica gracillima, Acer colchicum rubrum, the young growth dark crimson-red; Arundo donax variegata, &c. A Silver Medal was awarded. Messrs. Veitch showed also a collection of cut flowers receiving a Large Bronze Medal; Aquilegia, Papaver orientale, Irises (English and Spanish), I. Susiana, Pyrethrums, and Anemones were the chief constituents.

From Mr. T. S. Ware, Tottenham, came a group of varieties of Papaver orientale, Campanula glomerata, Cypripedium spectabile, Iceland Poppies, Pyrethrums, Centaurea montana vars., and numerous others of a like character, making a bright display, and for which a Large Bronze Medal was awarded.

Messrs. P. Barr & Son, Covent Garden, showed a

collection of a somewhat similar nature, in which Tradescantia virginica, Paeonia albiflora vars., Hemerocallis Dumortieri, H. flava, and Irises were conspicuous. (Bronze Medal.)

Messrs. Collins, Bros., & Gabriel, Waterloo Bridge Road, also showed Pyrethrums, Paeonies, &c., with Ixias and Sparaxis.

Mr. R. Scott, gr. to Miss Foster, The Holme Gardens, Regent's Park, N., showed an extensive group of plants, tastefully arranged, and in which fine specimen Fuchsias formed a feature.

A Large Silver Medal was awarded to Mr. B. S. Williams, Upper Holloway, for an extensive and comprehensive group of numerous small Orchids and Sarracenias, arranged with Adiantum, &c.; and to Messrs. J. Laing & Sons, Forest Hill, for a good group of tuberous Begonias, backed by fine Caladiums, Palms, and Dracaenas, with a few Gloxinias.

A Large Bronze Medal was given for a group of vigorous Petunias and numerous very pretty ornamental grasses from Messrs. J. Carter & Co., High Holborn, W.C.

A group of Orchids from Messrs. H. Low & Son, Clapton, received a Silver Medal. The best plants were Dendrobium Bensonia, D. B. zeylanicum, Cattleya Mendelii in variety, C. gigas, Phalenopsis grandiflora, Cypripedium Lawrenceanum, and C. bellatulum (see also Certificates).

A Small Silver Medal was awarded to both Mr. Hill and to Mr. G. H. Elliott, gr. to W. F. Darnell, Esq., Stamford Hill, each of whom had a pretty collection of Cattleyas. Messrs. F. Sander & Co., St. Albans, contributed a small number of good Orchids, of which Phalenopsis Kimballiana, Cypripodium Andersonianum, Cattleya Mendelii, Lycaste Speneri (pure white), and Odontoglossum Coradinei splendens were prominent examples.

A group of Anthuriums from Messrs. J. Peed & Sons, Ruppell Park Nurseries, S.E., were very bright, and a Large Bronze Medal was given.

Messrs. C. Lee & Son, Isleworth, had Statice floribunda, and Mr. Balchin, Brighton, Leschenaultia bicolor, a fine old plant which he grows to perfection.

Messrs. Paul & Son, Cheshunt, sent a few rock plants, among which were Dianthus alpinus, Ramonda pyrenaica alba, Phyteuma comosum, Mimulus radicans, and Rosa speciosissima pimpinellaefolia, about 3 inches in height, with pure white flowers.

CUT FLOWERS.

Roses.—These, in combination with the fine show of fruit, made an admirable display in the annexe.

In the amateurs' class for twelve varieties of Roses, three trusses of each, Mr. P. Perry, gr. to Mrs. Rowlett, The Woodlands, Cheshunt, was 1st.

In the nurserymen's class for twenty-four varieties, three trusses of each, Mr. C. Turner was 1st, with some remarkably good flowers for the season of Annie Laxton, La France, Boildeau, Mdle. Eugene Verdier, Rubens, Dr. Andry, Duchesse de Valombrosa, Captain Christy, Devonensis, Lady Mary Fitzwilliam, Celine Forestier, Marguerite Brassac, Marguerite de St. Amand, Gloire de Dijon, Prince Camille de Rohan, Sir Garnet Wolseley, and Souvenir d'un Ami. 2nd, Messrs. Paul & Son, Old Nurseries, Cheshunt.

In the class for twelve blooms, one variety, Mr. Robins, gr. to Colonel Lee, Hartwell House, Aylesbury, was 1st, with some superbly-coloured flowers of Maréchal Niel.

In that for twelve trusses of any colour, Messrs. Paul & Son were 1st with Lady Mary Fitzwilliam.

Then came a class for six fine-scented Roses, three blooms of each—a useful one, as showing the most fragrant varieties. Messrs. Paul & Son were again 1st with Lady Mary Fitzwilliam, &c., Maurice Bernardin, La France, American Beauty, Violette Brouyere, and Senateur Vaisse.

Hardy Herbaceous Flowers.—These made a great feature, being arranged in large bunches, and it was a close struggle for supremacy between Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, and Messrs. Paul & Son, the prizes being awarded in the order named. Mr. Ware had Hemerocallis flava, two fine varieties of Papaver orientale, and the orange and yellow form of P. nudicaule; some fine bunches of Lilies, double Pyrethrums, Gladiolus Colvillei alba, Cypripedium spectabile, Campanula glomerata dahurica, Dictamnus fraxinella, Paeonies, Delphiniums, &c.

Stove and Greenhouse Cut Flowers.—There was but one collection of twenty-four trusses, a very good one indeed, which came from Mr. H. James, and included Anthurium ferri-roseo, A. Scherzerianum in two fine varieties; Bougainvillea glabra, Brassia verrucosa, a fine scarlet Cactus, Ixora Cypheri,

Cattleya Skinneri, Calanthe Dominiana, Stephanotis floribunda, Epacris miniata splendida, &c.

Trusses of Orchids.—Two fine stands of these were shown by Mr. J. Douglas, gr. to F. Whitbourn, Esq., Great Gearies, Ilford, and Mr. J. Cypher, Exotic Nurseries, Cheltenham. The effect of Mr. Douglas' undoubtedly fine flowers was marred by being set up in ordinary flower-pots, which materially detracted from their effectiveness. Mr. Cypher had put his up in elegant glasses, which helped their attractiveness.

Collections of Iris.—Messrs. Barr & Son, King Street, Covent Garden, were placed 1st, with a fine lot of bunches, fresh, bright, and effective, mainly of the I. germanica type; Mr. T. S. Ware was placed 2nd, with a rather more representative collection, but many of the bunches much soiled by the weather, and deficient in good blooms; 3rd, Messrs. Paul & Son.

Pelargoniums.—Stands of twenty-four bunches of show varieties made a good display, Mr. C. Turner leading the way with a very fine lot, chief among them being Maid of Honour, Marion, Magnate, Mandarin, Duke of Norfolk, Pluto, Corinna, Spotted Beauty, Vivid, Outlaw, Sister of Mercy, The Czar and Magpie.

Zonal Pelargoniums, in twenty-four bunches, were a good feature also, Mr. D. Phillips coming 1st, with a very fine lot.

FRUIT.

This was of a uniformly high quality, and the competition well sustained. Mr. J. Roberts, Gunnersbury House, Acton, was 1st for a collection of dishes of fruit, in competition for the prizes offered by the Fruiteers' Company, and made a most creditable show in all instances. Grapes, Black Hamburgh and Foster's Seedling, were remarkably good in finish and form, and large in both berry and bunch. Brown Turkey Fig, Lord Napier Nectarine, Keen's Seedling Strawberry, Smooth Cayenne Pine, and several Melons, were also of high quality. He showed eighteen dishes in all. Mr. Edmonds, Bestwood Gardens, Arnold, Notts, was a good 2nd, Peaches and Nectarines being very fine, but variety was wanting here. Pines and Melons were good, and he also sent the Cape Gooseberry, which attracted a deal of notice. This exhibitor was 1st for three bunches of Black Hamburgh Grapes, showing bunches satisfactory in every way; and with the same variety he led for the best basket of black Grapes, showing equally well.

For the best three bunches of black Grapes (not Hamburghs) Mr. J. Roberts led with grand bunches of Madresfield Court, with very large berries and good in form. Mr. Cakebread, Rayners, Bucks, was 2nd, showing the same variety, and this exhibitor took 1st for a capital Queen Pine. Mr. J. Coomber, The Hendre Gardens, Monmouth, coming in as a close 2nd—Mr. J. Muir, gr. to Hon. Talbot, Margam, Glamorganshire, taking the chief position in the class for any other Pine, showing a good example of Smooth Cayenne.

White Grapes were also very satisfactory. Mr. Chuck, gr. to P. Thelluson, Esq., Broadworth, Doncaster, showed very good Duke of Buccleuch fairly free from spot, and took leading honours in the class for three bunches of white Grapes, the 2nd place being accorded to Mr. J. Roberts for excellent and large bunches, of fine shape, of Foster's Seedling. Muscats generally were not ripe, Mr. G. Grimmett, gr. to A. Richards, Esq., Blenheim House, Hounslow, having the best, which were fairly well ripened; and he took 1st in this class—the best basket of white Grapes being sent from Mr. R. Grindrod, gr. to Mrs. Greathead, Whitfield, Herts, who also showed good Muscats.

It is rather difficult to see why prizes are offered for "a basket of Grapes," and it would be of more practical value if the same prizes were devoted to baskets of Grapes as packed for transit, or for market.

Melons were numerous, the chief prize going to Mr. T. Hare, Grantham, with medium sized fruit.

Mr. Blair, gr. to the Duke of Sutherland, Trostham, Stoke-on-Trent, was 1st with excellently-grown Violette Hative and Lord Napier, and he also had the best Cherries with Black Tartar and Bigarreau Napoleon.

For Peaches and Strawberries Mr. W. H. Divers, Ketton Hall Gardens, led with British Queen and Sir C. Napier Strawberries, and Royal Albert and Royal George Peaches; Mr. J. Worthing, gr. to A. Moss, Esq., Chadwell Hall, was 2nd for Strawberries. Very fine fruits of Sir Charles Napier.

From Messrs. Rivers & Sons, Sawbridgeworth, Herts, came a collection of Peaches and Nectarines fruiting in pots, and Citrus vulgaris also in fruit. Fruits

of Nectarine Lord Napier, Peach Crimson Galande, and Plum The Czar, were also shown. (Bronze Medal.)

BOTANICAL CERTIFICATES.

Phalaenopsis speciosa var. *Imperatrix* (Major-Gen. E. S. Berkeley), differing from the type by its uniform darker colouring.

Ardisia mamillata (Veitch), fully described in our issue for December 31, 1887, p. 809, with illustration.

Gymnogramma Pearcei robusta (Veitch), finely divided fronds, pale bright green in colour.

Nepenthes Curtisii (Veitch), see *Gardeners' Chronicle*, December 3, 1887, p. 689.

Elaeagnus pungens maculatus (Veitch), golden variegation in the centre of the leaf.

Senecio elaeagnifolia (Veitch), leaves ovate obtuse, entire, dark green, with a buff under-surface and narrow border of the same.

Aralia Maximowiczii (Veitch), leaves digitate palmate, five to seven, dark green; petioles reddish; 4 feet high.

Sambucus racemosa serratifolia (Veitch), leaves with a deeply jagged margin.

Erigeron aurantiacum (Ware), disc and rays orange; height about a foot.

Cattleya Mendelii, var. *H. Little* (Hill), sepals and petals suffused rose, more intense at the tip of the petals; lip very deeply coloured median lobe, rest white, throat yellow lined with purple-rose.

Cattleya Mossia claptoniensis (Low), rose-purple, median lobe of lip large and very deep in colour, which runs down the throat.

Cattleya Mossia Fuchii (Low), petals suffused rosy-purple, tips more intense, lip dark, expanded; rest white.

Cypripedium bellatulum (Low, Cypher, Laing, Williams), see *Gardeners' Chronicle*, last week.

Sarracenia Williamsi × (Williams), green veined with red-brown, medium height, wide tube, and large lid.

Leea amabilis splendens (Williams), leaves pinnate, the divisions oblong, serrate, purple-bronze, with a white midrib.

Thuiopsis borealis lutea (Sloccock), the young growths golden; habit compact.

Odontoglossum cordatum splendens (Sander), sepals deeply coloured; lip white, spotted brown.

Odontoglossum coradinei hemileucum (Sander), large pale spots, and the whole flower large.

Phalaenopsis Kimballiana (Sander), pale yellow, with brown transverse bars, median lobe of lip and column pale rosy-violet; the lateral lobes of the lip white, the space between yellow (first time of flowering in Great Britain).

Caladium auriflamma (Laing), red, with green margin.

Caladium La Lorraine (Laing), red self colour.

Caladium Duchesse de Montemart (Laing), leaves yellowish-white.

Anthurium Laingii (Laing), spathe white, small and narrow, spadix rose.

Ramondia pyrenaica alba (Paul & Son), see Royal Horticultural Society's report last week.

Dianthus plumarius annulatus (Paul & Son), white, eye reddish-brown, margin lacerated.

Cattleya Mossia gigantea (Cypher), very large, pale rose; the median lobe and the lip paler, very large and expanded, spotted with dark rose towards the throat, which is yellow.

FLORICULTURAL CERTIFICATES.

Pyrethrum Jubilee (Balchin & Sons), ruby-crimson, single.

Viola Snowflake (Chambers), very free, and pure white.

Epidendrum O'Brienianum × (Veitch), see p. 770.

Begonia Arthur Mallet (Veitch), leaves a sort of rosy wine-colour; promising character.

Rhododendron (greenhouse) *Aurora* (Veitch).

Rhododendron (greenhouse) *Ophelia* (Veitch).

Begonia Camellia (Laing).

Begonia Claribel (Laing).

Begonia Duchess of Teck (Laing), deep yellow, double.

Begonia Lord Loughborough (Laing).

Begonia Lady Idlesleigh (Laing).

Begonia Monarch (Laing).

Begonia Viscountess Cranbrook (Laing).

Gloxinia Meteor (Laing), pinkish-purple.

Gloxinia Nalis (Laing), spotted flowers.

Pyrethrum (double) *Leonard Kelway* (Kelway).

Pyrethrum (double) *Queen Sophia* (Kelway), a very fine delicate blush.

Pyrethrum, single, *Mr. Santley* (Kelway).

Pyrethrum, single, *Duke of Connaught* (Kelway), a ruby-colour, large size, and fine form.

Pæony Lady Gwendoline Cecil (Kelway), a pale variety.

Pæony Millais (Kelway), maroon.

Begonia, single, *J. E. Midson* (Cannell).

Begonia, single, *Prince of Orange* (Cannell).

Begonia, double, *Mrs. Midson* (Cannell), white.

Begonia, single, *Mrs. B. Wynne* (Cannell), rose, with fine shell-like petals.

Begonia, single, *Sir J. Pendel* (Cannell), crimson.

EDINBURGH BOTANICAL.

JUNE 14.—The Society met this evening in the class-room, Royal Botanic Garden, Dr. Craig, President, in the chair.

The following communications were read:—

I. *Obituary notice of Professor De Bary.* By Professor Bayley-Balfour.

II. "Dimorphism in New Zealand Veronicas." By Robert Lindsay, Curator of Royal Botanic Garden.

III. "On the Leaves of Climbing Plants." By W. E. Fothergill, M.A.

IV. "On Similar Modifications in the Characters of Different Plants." By P. Sewell.

V. "On Temperature and Vegetation at the Royal Botanic Garden, Edinburgh, during May." By R. Lindsay, Curator.

The month of May was, in general, dry and cold, with easterly wind. The thermometer was six times at or below the freezing point during the month, indicating collectively 5° of frost as against 12° during last May. The lowest readings were—on the 3rd, 32°; 9th, 31°; 10th, 32°; 11th, 29°; 12th, 31°; 29th, 32°. The lowest day-temperature was 54° on the 4th of the month, and the highest 70° on the 17th. The foliage of most of the ordinary forest and ornamental trees and shrubs came rapidly forward, and notwithstanding the backward kind of weather experienced, fine luxuriant leaves have been developed. Those which have already flowered, such as Horse Chestnut, Lilac, Azaleas of sorts, Magnolias, and the various species of *Pyrus* and *Prunus*, have been considerably above the average in this respect. The profuse manner in which the many varieties of Holly have flowered is very remarkable. Herbaceous plants are generally late in flowering, but promise to be fine later on. The rock-garden was very attractive during the month from the large number of plants in blossom; 367 species and varieties came into flower during May, while a large proportion of those which began to flower during the previous month were still in good condition. Among the best of those which opened in May were:—

Andromeda fastigiata, *Androsace Hookeriana*, *A. villosa*, *Anemone alpina*, *A. a. sulphurea*, *A. narcissiflora*, *A. polyanthes*, *Anthemis aizoon*, *Anthyllis eriantha*, *Arnebia echioides*, *Astragale alpina*, *Bryaethus erectus*, *Corbularia tenuifolia*, *Corydalis nobilis*, *Cytisus Ardoinii*, *C. decumbens*, *Daphne cneorum*, *D. collinum*, *Dianthus glacialis*, *Dracocephalum grandiflorum*, *Enkianthus himalaicus*, *Erius alpinus*, *Erythronium americanum*, *Gentiana verna*, *Iris cengialti*, *Pentstemon Menziesii*, *Primula farinosa*, *P. involucrata*, *P. longiflora*, *P. Olga*, *P. Reidi*, *P. sikkimensis*, *Raununculus amplexicaulis*, *R. anemonoides*, *R. insignis*, *R. pyreneus*, *Rhododendron lepidotum*, *Silene acaulis*, *S. pusillus*, *Trifolium uniflorum*.

VI. "On Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, for May, 1888." By E. Bullen, Curator.

"The thermometer has been at or very near the freezing point six times during the month. The night temperature for the remainder of the month was above the average. From the 1st to the 18th the day temperature (in the shade) was below the average. From the 18th to the 26th (both inclusive) the day temperature was high, with bright sunny days and continuous dry weather, 69° being the maximum and 63° the minimum for the nine days. The last three days were showery. The rainfall was light until the evening of the 18th, when we experienced a severe thunderstorm, which was repeated with still greater severity on the afternoon of the 19th. Such a storm of thunder, lightning and rain, accompanied by hailstones seldom, if ever, been experienced in this part of the country. The rainfall within one hour amounted to three quarters of an inch, which Professor Grant states exceeded any rainfall in the same space of time recorded in the annals of the Glasgow Observatory with the exception of the memorable rainfall of August 31, 1887. Vegetation has developed rapidly during the month, making considerable amends for an otherwise backward season.

Hardy trees and shrubs of all kinds are very prolific of bloom."

SCOTTISH PANSY.

This Society held its forty-fourth annual meeting in Lyon & Turnbull's Rooms, Thistle Street, Edinburgh, on the 15th inst. While the show in point of quality and size of blooms was distinctly superior to that of last year there was a perceptible falling off in numbers in some of the classes. Eastern and Northern growers have had a very disastrous time for many weeks back, the weather in these districts having been very unfavourable for Pansy culture or indeed for anything else. The Western growers may be said to have made the show, and they carried off the largest share and the chief of the honours. The President's (Mr. John Sutherland, Lenzie) prize—a Gold Medal to the competitor taking the largest number of prizes—went to Mr. R. Stewart, gr., Lenzie. Mr. Sutherland, Lenzie, in the open class of twelve show Pansies, in twelve varieties raised by competitor between 1884 and 1888 inclusive, took the Gold Medal awarded to that class. Mr. A. Irvine, Tigh-na-bruaich, took 1st honours in the nurseryman's class of twenty-four show Pansies, dissimilar; Messrs. Laird & Sons, for twenty-four fancy Pansies, dissimilar, carried off the 1st prize. Messrs. Dicksons & Co. had the best bunches of bedding Violas. Amongst practical gardeners, Messrs. R. Stewart, Borrowman, Beeslack, Mark, Craighinning, divided the honours pretty fairly between them.

Amateurs were well to the front in point of quality, Messrs. Russel, Cawdor; Ross, Laurence-kirk; Ritchie, Dennie; Kay, Garganock; Stewart, Lennoxton; R. White, Bathgate; and Dick, Kirknewton, keenly competed for the honours, and each had his share—the first-named gentlemen taking the two 1st prizes for eighteen blooms in each section (show and fancy) respectively. Mr. Borrowman exhibited a collection of new seedling fancy Pansies, to which was awarded a First-class Certificate. The most remarkable flower in the lot was one named David Strachan, which for size, substance, and richness and novelty of colouring well deserved the award given it by the judges. Deep black blotches on the base, and lateral petals boldly bordered with deep vermilion; the upper petals, orange-yellow flamed with deep maroon, and the whole edged, picotee fashion, with light canary, roughly indicates colours but inadequately describes the splendid effect of the combination. Mr. Campbell, Higher Blantyre, also received a First-class Certificate for several excellent seedlings, the most striking of which was Lizzie Duncan, with deep maroon lower and lateral petals, the upper ones rich purple and all belted with pure white and picotee edge. Mr. Robert White, Bathgate, received a First-class Certificate for William Davidson, a fancy variety of excellent points, and rather novel colouring, all petals being blotched with deep black and edged boldly with rose-crimson. Messrs. R. B. Laird & Sons had an excellent exhibit of Violas, as also had Messrs. Dicksons & Co.

The ladies' competition for table decorations is always a pleasing feature at these shows, and was especially so on this occasion. Mrs. Black, Liberton; Miss Greive, Pilrig Cottage; Mrs. Lance, Pinkhill, and others vying with each other for the honours keenly.

ROYAL NATIONAL TULIP.

JUNE 9.—The annual exhibition of this Society took place as usual in the gardens of the Manchester Botanical and Horticultural Society at Old Trafford. Considering the season with its rapid alternations of weather, from great heat to biting east winds and frost in the space of twenty-four hours, the wonder was that the exhibition was so good as it proved. The Rev. Mr. Horner, in the further north of Kirkby Lonsdale, had some very fine blooms this year, but he was unable to exhibit owing to the flowers being past; and for the same reason, Mr. James Thurston, of Cardiff, was also unable to be present.

Seedlings.—In the leading class for twelve dissimilar Tulips, two feathered and two flamed of each division, Mr. Alderman Woolley, Stockport, was 1st out of five competitors, with bizarre, feathered, Sir Sidney Smith and Sir J. Paxton; flamed, Sir J. Paxton and Dr. Hardy; rose, feathered, Heroine and Mabel; feathered, Triomphe Royale and Mabel; byblockmen, feathered, Seedling and Jeannette, a new Stockport raised flower; flamed, Chancellor and Walker's Duchess of Sutherland.

There were also five collections of six dissimilar

Tulips, and here Mr. J. H. Wood, Royton, was 1st, with byblömen, feathered, Masterpiece; flamed, Sir J. Paxton; rose, feathered, Modesty; flamed, Mabel; byblömen, feathered, Talisman; flamed, Duchess of Sutherland.

This same class is also repeated, the competition confined to half-guinea subscribers only. Here Mr. Isaac Hesford was 1st, with bizarre, feathered, Sir J. Paxton; flamed, do.; rose, feathered, Industry, and flamed, Mabel; byblömen, feathered, Mr. Pickrell; flamed, Talisman.

Then followed one of the most interesting classes, viz., for three feathered Tulips, one of each division, seven stands competing, Mr. Alderman Woolley being 1st with bizarre, Typo; rose, Alice, and byblömen, Adonis. 2nd, Mr. Isaac Hesford, with bizarre, Sulphur; rose, Mrs. Collier; byblömen, Sylvester. 3rd, Mr. E. H. Schofield, with bizarre, Waterloo; rose, Modesty; and byblömen, Mary; 4th, Mr. J. H. Wood.

There were also seven stands in the following class for three flamed Tulips, Mr. A. Fearnley, Lowton, being 1st, with bizarre, Sir J. Paxton; rose, Mabel; byblömen, Maid of Orleans. 2nd, Mr. W. Kitchen, with bizarre, Sir J. Paxton; rose, Mabel; and byblömen, Lord Denman. 3rd, Mr. J. H. Wood, with bizarre, Sir J. Paxton; rose, Aglaia; byblömen, Lord Denman. 4th, Mr. E. H. Schofield.

Then followed two classes for two dissimilar Tulips, one class was for maiden growers only, and in this there was but one competitor, Mr. Thomas Holden, Royton, being awarded the 1st prize with rose, flamed, Seedling; byblömen, feathered, Mrs. Jackson, a small but very correct flower. In the open class for the same number, Mr. Thomas Simpson was, 1st with bizarre Sir J. Paxton, both feathered and flamed.

A large number of blooms was staged in the classes for single flowers; commencing with the bizarres, the feathered flowers were arranged as follows:—1st, Mr. W. Prescott, with Lord Lilford.

Bizarres, Flamed.—1st, Mr. Alderman Woolley, with Sir J. Paxton.

Roses, Feathered.—1st, Mr. Alderman Woolley, with Lizzie.

Roses, Flamed.—1st, Mr. H. Housley, with Annie McGregor.

Byblömens, Feathered.—1st, Mr. Alderman Woolley, with King of the Universe.

Byblömens, Flamed.—1st, Mr. H. Housley, with Adonis.

The premier feathered flower was byblömen, Dymock's King of the Universe; and a First-class Certificate of Merit was accorded to the raiser for this fine addition to a restricted class. The premier flamed Tulip was bizarre Sir Joseph Paxton, both premier blooms being shown by Mr. Alderman Woolley.

Breeder Tulips.—As is usual these were finely shown, though not so large in size as is sometimes the case; but they were generally bright in colour, and S. Barlow, Esq., won the leading prizes. In the class for six dissimilar flowers, two of each class, Mr. Barlow was 1st, with two seedling bizarres; roses, Miss Burdett Coutts and Mr. Barlow; byblömens, Glory of Stakehill and George Hardwick. 2nd, Mr. W. Kitchen, with bizarres Sir J. Paxton and Seedling; roses, Mabel and Annie McGregor; byblömens, Seedlings. 3rd, Mr. J. H. Wood, with bizarres, Lord Delamere and Sir J. Paxton; roses, Miss B. Coutts and Mabel; byblömens, Alice Grey and Glory of Stakehill. 4th, Mr. A. Moorhouse.

There were nine stands of three dissimilar breeders, one of each class; and here Mr. S. Barlow was again 1st with bizarre, Ilpworth's 20s. 6l.; rose, Miss B. Coutts; and byblömen, Glory of Stakehill. 2nd, Mr. W. Kitchen, with bizarre, Sir J. Paxton; rose, Annie McGregor; and byblömen, Adonis. 3rd, Mr. J. H. Wood; 4th, Mr. Alderman Woolley.

Then came the classes for single blooms—bizarre breeders: 1st, Mr. Thomas Holden, Unknown; 2nd, Mr. Alderman Woolley, with Sulphur; and 3rd, with Dr. Hardy; 4th, Mr. S. Barlow, with Richard Yates; then followed in order of merit, William Lea, Sir J. Paxton, and Horsti. Rose breeders: 1st, Mr. S. Barlow, with Mabel; 2nd, Mr. T. Holden, Seedling; 3rd, Mr. E. H. Schofield, with Annie McGregor; 4th, Mr. S. Barlow, with Miss B. Coutts, followed by Annie McGregor, Burlington, Juliet, and Lucretia. Byblömen breeders: 1st, Mr. E. H. Schofield, with Mrs. Hardwick; 2nd, Mr. S. Barlow, with Seedling; and 3rd with Talisman; 4th, Mr. T. Simpson, with Faony. Following these in order of merit were Martin's, 117, Alice Grey, and Glory of Stakehill.

The premier breeder Tulip was byblömen Glory of Stakehill, shown by Mr. Isaac Hesford.

GARDENERS' ORPHAN FUND.

A MEETING of the Executive Committee took place at the "Clarendon" Hotel, Adelphi, on Friday evening, June 15, at 7 P.M., Mr. George Deal, chairman of the committee, presiding over a full attendance. The minutes of the last meeting having been read, the hon. secretary announced there is a balance at the bank of £439 19s. 5d.

A meeting of the General Committee of the late Floral Fête was then held, Mr. Assbee, the Superintendent of the Market, and a goodly number of growers, being present. Mr. W. Richards, the hon. secretary of the sub-committee which carried out the details of the Fête, then read the following report [abridged]:—

"To the Committee of the Gardeners' Orphan Fund Evening Promenade Fête.

"Your sub-committee have to report that the fête held in the Flower Market, kindly lent for the occasion by his Grace the Duke of Bedford, and under the patronage of H.R.H. Princess Mary Adelaide, Duchess of Teck, on Wednesday evening, June 6, proved a brilliant success—the total number of ladies and gentlemen present being nearly 7000. The Press notices, copies of which are submitted, were of an extremely favourable character. The total expenses of the fête amount to £74 8s. 7d. The amount of money collected in the boxes presided over by twenty-eight young ladies was £127 7s. 10d.; this, with the handsome donation of £100 from his Grace the Duke of Bedford, and a few sums received subsequently, make up a total of £237 11s. 4d., leaving a balance of £163 2s. 9d. to the credit of the Fund. Your sub-committee desire specially to express their hearty thanks to the various officials and growers connected with the market for their liberal assistance so cheerfully rendered, and recommend that the best thanks of this meeting be accorded to them.

"Signed, on behalf of the sub-committee,
"GEO. DEAL, Chairman.
"W. RICHARDS, Secretary."

The report having been duly received a vote of thanks was passed by acclamation to the Duke of Bedford for granting the use of the Flower Market for the purposes of the fête, and the Chairman was requested to convey the same to his Grace. A letter of thanks to the market growers, 250 in number, was approved, and a copy ordered to be forwarded to each. Hearty votes of thanks were also passed to Messrs. Bourne, W. Richards, and Assbee; and the latter, in responding, said he was quite certain that if another fête should be attempted the market growers would be quite willing to render their assistance; and with the experience they had gained he thought a second attempt would prove very much more successful than the first, satisfactory as that had been.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending June 18, is furnished from the Meteorological Office:—

"The weather during this period has undergone a decided change; at first it was dull and very showery in the west and north, fine and rather warm in the south-east; on Wednesday night, however, a change took place, the wind shifted to the north-westward and northward at our eastern stations, with cold rains, while the disturbed weather in the west and north-west showed signs of improvement. Gloomy, cold weather continued prevalent in the east, with rain at times, while in the west it gradually became bright, dry, and at times warm. Thunderstorms occurred in many places on the 13th and 14th.

"The temperature has been below the average everywhere, the deficit ranging from 4° to 6° over the English districts, from 2° to 3° in Ireland, and from 1° to 2° in Scotland. The highest of the daily maxima were registered on very various dates; over the Midlands and eastern parts of England they were recorded mainly on the 12th, and varied from 69° to 74° in value; in Scotland and Ireland (as a whole) they occurred towards the end of the period, and varied in value from 74° to 78° in the former country, and from 70° to 75° in the latter; in Wales and the west parts of England the conditions approximated

to those of Ireland. The lowest of the minima (and they were very low for the time of year) occurred in central and southern England on the 18th, but over Norfolk on the 14th and 15th, in Scotland and Ireland on the 12th or 13th. Over some parts of the Midlands and southern counties the thermometer fell to 36° or 37° in the shade, and to rather below the freezing point on the grass early on the 18th, while in the north of Norfolk frost occurred on the grass both on the 14th and 15th.

"The rainfall was more than the mean in 'Ireland, N.,' and equal to it in 'England, E.;" in all other districts it was less, the deficit being as great as four-tenths of an inch in 'Scotland, W.,' and three-tenths in the northern parts of Great Britain.

"Bright sunshine was very deficient over the eastern parts of England (where it had been in excess previously), but was abundant in the west and north. The percentage of the possible duration varied from 24 in 'England, E.,' and 26 in 'England, N.E.,' to 44 in 'England, N.W.,' to 56 in 'Ireland, S.,' and to 57 in the 'Channel Islands' and 'Scotland, N.,"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

AMARYLLIS DOUBLE FLOWER: *H. J. R.* The doubling of flowers of the Amaryllis is a comparatively rare occurrence; still there are many such recorded.

ASPARAGUS BEETLE: *B. B.* What you send are the eggs of the Asparagus beetle, which is only too common. Cut off the shoots and burn them. When the grubs appear, dip the shoots in a mixture of soft-soap, $\frac{1}{2}$ lb.; flowers of sulphur, $\frac{1}{4}$ lb.; and one pint of hot water.

BROCCOLI, EDINBURGH LATE: *T. M. & Sons.* A close well protected head, and useful at this season of the year; seems to be identical with the one noticed in our last issue.

CORRECTIONS.—In article "The Botanical Gardens, Old Trafford," at p. 744, Mr. Clapham, who put up the rockwork there, resides at Stockport, not Southport, as there stated.—In report of Bath and West of England show, p. 757, read Tagart, not Sayart; Derham, not Derlaw; A. W. Summers, not H. W. Summis; Giddings, not Gibbins.

FASCINATION IN CONVULVULUS: *T. W.* Not uncommon in any vigorous and quick-growing plant.

GLOIRE DE DIJON ROSE-BUDS FALLING OFF: *Subscriber.* In the absence of details of management, we can merely surmise that the loss of buds in the spring may have been due to insufficient ventilation, when they would "fog off"; dryness at the root may have caused them to fall; or the undue development of shoots which grew coarse and strong at the expense of the more moderate flowering shoots. It is not wise to let these big shoots grow, as it will usually be found that the other parts of the tree will eventually suffer from it, but cut them at the base, and by doing so get a few less rampant growths, which will be more floriferous, instead of one very strong one.

GRAPES CRACKING: *R. J. H.* The berries will sometimes "crack" when too much water is given, especially if the soil is not porous, or the drainage is defective. Vines should not have any water, if planted out, after a thorough watering given just when the stoning process is completed; and if in pots, considerable caution is required. Allowing pot-vines to root through into dung, or moist tan, might produce cracking. If the roots are outside, or many of them, vines in unprotected borders suffer greatly if, when near the period of ripening, rain fall heavily, and early crops are more liable to injury of this kind than later ones—owing, probably, to the soil being drier later in the summer. Leaving too few berries on a bunch will tend to cause the berries to crack their skin; as will injury to the skin from the too free use of sulphur on the pipes.

HARDY FERNS FOR UNHEATED GREENHOUSE: *A Constant Reader.* *Osmunda regalis*; *Athyrium filix-fœmina*, many forms; *Adiantum Capillus-veneris*; *Polystichum angulare*; *Polypodium vulgare*; *Woodwardia radicans*; *Scolopendrium vulgare*, many beautiful varieties; *Cystopteris fragilis* in variety; *Lastrea dilatata*, do.; *L. filix mas*, do.; *Trichomanes radicans*; *Woodsia alpina*, and *W. ilvensis*; and *Blechnum spicant* in many varieties. Some of these are evergreen, and remain in good condition through the winter. Given a little heat,

many more fine Ferns of New Zealand, Tasmania, and Australia, might be added to the list.

INSECTS: *H. H.* The beetle sent, found on a decayed Potato-stem, is one of the burying beetles (*Necrophorus Vespillo*). It had nothing to do with the withered condition of the plant.—*W. I. S.* The young Apple-shoots and leaves have been gnawed and fastened together with fine threads by the caterpillars of several kinds of small moths. One is a small Geometer, which agrees with Hubner's figure of the larva of *G. vanaria*; some larva of small Tortrices, one of them like that of one of the Rose moths, which has just arrived at the winged state. Hand-picking the injured leaves is the best remedy. *I. O. W.*—*A. B.*, *Hendon.* Your Genista is covered with a Dodder (*Cuscuta*), probably introduced in the peat. It is pretty enough, but very destructive. Destroy it at once.

LAWN GREEN IN WINTER: *E. B. R.* If the land is in good heart, and moss is allowed to take possession of the turf—and that is not likely if the grass seeds were sown this season—it will remain green during the winter. Do not mow after there is any appearance of frosts occurring in October.

LEAVES AND FRUIT DROPPING FROM PEACH: *A Subscriber.* The effect, doubtless, of the too severe fumigation with tobacco-paper. You can do nothing.

LILIUM ACRATUM, &c.: *Wentfield.* No; not in a collection of greenhouse and stove plants.

MUSHROOMS: *H. W.* The specimens were much decayed, but they are either the true Mushroom or the Horse Mushroom; in either case wholesome when fresh.

NAMES OF PLANTS: *C. W. D.* 1 and 2, *Eremurus spectabilis*.—*C. M. O.* Indeterminable; please send specimens further advanced.—*J. Falconer.* 1, *Genista radiata* (*Cytisus radiatus*); 3, *Aira præcox*.—*Constant Subscriber.* We cannot undertake to name florists' forms of *Pelargoniums*.—*Cefaitilla.* *Tamarix gallica*.—*T. T.* 1, *Fraxinus Ornus*; 2, *Cornus sanguinea*.—*J. S.* 3, *Sedum sarmentosum*, variegated; usually called *carneum*.—*A. B. B.* *Nedera Regoeriana*.—*A. L. H.* did not affix numbers to his specimens. The shrub is *Skimmia japonica*; the red flower, *Centraothus ruber*; the yellow flower, *Asphodelus luteus*; a specimen with finely cut leaves is *Thalictrum flavum*; then there are two *Geraniums*, one *G. pratense*, with purplish-blue flowers, and one with crimson-lilac flowers and more finely divided leaves, *G. sanguineum*.—*Broomyard.* 1, *Ulmus campestris suberosa*; 2, *Carpinus betulus* (*Hornbeam*); 3, *Ulmus montana* (*Wych Elm*).—*J. W.* 1, *Magnolia acuminata*; 2, *Diervilla*, or *Weigela rosea*.—*J. Smith.* 1, *Mesembryanthemum polygonanthum*; 2, *M. blandum*.—*J. Morgan, Paisley.* *Philodendron* sp.; send leaf, and we will name it for you.—*W. P.* 1 and 2, *Cypripedium barbatum*; 3, *C. villosum*.—*Capt. Hincks.* *Cattleya Mossiae* var.; the colouring of the lip is rather remarkable.—*E. S. B.* A good coloured form of *Dendrobium nobile*.—*F. C. W.* *Epidendrum falcatum*.—*S. S. Borden.* 1, *Saxifraga Macbaniana*; 2, *S. Aizoon* var. *rotata*; 3, *Viburnum opulus* (*Guelldres Rose*); 4, *Philadelphus coronarius*; 5, *Weigela rosea*; 6, *Sedum glaucum*; 7, *Vicia major*.

PLANTAINS ON A LAWN, AND GUANO: *E. W.* The extirpation of these weeds, when large, can scarcely be accomplished by dressings of guano, without first spudding out the main portion of them; but any manure, loamy soil, wood-ashes, &c., applied in winter or early spring, has the effect of making the grass grow with vigour, so that the weeds, which are usually in the minority, are smothered out of existence by it in course of time. The guano, as fine powder, might be applied in rainy weather at the rate of 3 cwt. per acre—say, rather under 2 lb. per square rod of ground.

DIED.—On the 18th inst., CHARLES CAMPBELL BUCK, eldest son of Charles W. Buck, of Covent Garden, aged forty years.

MARKETS.

COVENT GARDEN, June 21.

[We cannot accept any editorial responsibility for the subjoined report, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

OUR market has been very quiet this week, Grapes meeting with a slow sale. Prices generally unaltered *James Webber, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

*. Orchid bloom in great variety, but the demand not very good.

SEEDS.

LONDON: June 20.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report to-day's market bare of buyers, and consequently a

complete absence of business. Quotations for all descriptions remain purely nominal. For both red and white Clover seed there is a firmer feeling, owing to the continued unfavourable reports of the growing crops. Sowing Mustard and Rape seed meet with increasing attention. Blue Peas are also inquired for. Other articles at this quiet season offer no subject for remark.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended June 16:—Wheat, 31s. 7d.; Barley, 25s. 3d.; Oats, 17s. 3d. For the corresponding week in 1887:—Wheat, 35s. 1d.; Barley, 21s. 10d.; Oats, 17s. 4d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: June 20.—Abundant supplies of all kinds of fresh vegetables, demand good, prices fair. Good supplies of new Potatoes and Peas. Old Potato trade very slow. Quotations:—Gooseberries, 2s. 6d. to 3s. per half sieve; Peas, 2s. 6d. to 3s. 6d. per bushel; ditto in sacks, 7s. to 8s. per sack; Asparagus, 1s. to 1s. 6d. per bundle; Cabbages, 1s. 9d. to 4s. per tally; Cauliflowers, 5s. to 7s. do.; Turnip Radishes, 1s. 9d. to 3s. 6d. do.; Greens, 1s. to 1s. 3d. per dozen bunches; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. 6d. to 2s. do.; spring Onions, 2s. to 2s. 6d. do.; Rhubarb, 1s. 6d. to 2s. 3d. per dozen bundles; Horseradish, 1s. 4d. per bundle; Seakale, 1s. 3d. per punnet; Endive, 1s. to 2s. per dozen; Mustard and Cress, 2s. per dozen baskets; Beetroots, 8d. per dozen; Cabbage Lettuces, 2d. to 6d. per score of 22; Cos Lettuces, 4d. to 8d. do.; foreign Onions, 5s. 6d. to 6s. per bag of 110 lb.; Mangels, 20s. to 22s. per ton.

STRATFORD: June 19.—The supply has been good during the past week, and a brisk trade was done at the following prices.—Cabbages, spring, 3s. to 5s. per tally; Mangels, 14s. to 20s. per ton; Onions, Egyptian, 5s. to 6s. per bag; Gooseberries, 3s. to 4s. per half sieve; do., 5s. 6d. to 7s. per flat; Cherries, 4s. per box; do., 4s. 6d. per flat; Radishes, 2s. to 2s. 9d. per tally; Cucumbers, Dutch, 1s. 3d. to 1s. 6d. per dozen; do., frame, 3s. to 6s. do.

POTATOS.

BOROUGH AND SPITALFIELDS: June 19.—Supplies of new Potatoes continue to steadily increase, and prices ease down accordingly. Quotations:—New: Jersey kidneys, 13s. to 20s.; Cornish, 12s. to 14s.; Lisbon, 9s. to 11s. per cwt. Old: Magnum Bonums, 25s. to 70s.; Regents, 40s. to 80s.; Champions, 20s. to 60s. per ton.

SPITALFIELDS AND COLUMBIA: June 20.—Quotations:—New: Jersey kidneys, 8s. 6d. to 10s.; Lisbon rounds, 6s. to 6s. 6d. per cwt. Old: Champions, 10s. to 30s.; Magnums, 12s. 6d. to 30s. per ton.

STRATFORD: June 19.—Quotations:—Old: Scotch Magnums, 40s. to 70s.; English light-land, 30s. to 50s.; do. dark, 10s. to 30s. per ton. New: Lisbons, 7s. to 8s.; Jersey kidney, 10s. to 11s. 6d. do.; flukes, 11s. 6d. to 12s.; Malts, 8s. to 9s. per cwt.

Imports.—The imports into London last week consisted of 41,438 boxes and 2675 half-boxes from Lisbon, 100 boxes from Lagos, 334 packages 32 cases and 184 casks from Malta, and 1067 cases from Bordeaux.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 84s. to 102s. 6d.; inferior, 74s. to 82s.; hay, prime, 84s. to 97s. 6d.; inferior, 75s. to 80s.; and straw, 34s. to 47s. per load.

PALMS AND PANDANUS.—Mr. Craig, Philadelphia, fires his Palm-house all summer, and gets a big growth on his young Palms in one summer. He considers Pandanus Veitchii a very profitable thing. Dracena fragrans is a very handsome decorative plant. It is propagated from canes imported from Trinidad. The canes are laid thickly together on the cutting bench, and when the eyes break the shoots are taken off and rooted. Propagation is much more rapidly accomplished in this way. *American Florist.*

**“ARCHIMEDEAN”
AMERICAN LAWN MOWERS.**

AWARDED
HIGHEST PRIZE
AT THE
Paris Exhibition, 1878;
and the JURY, in their REPORT
say:—
“The ‘ARCHIMEDEAN’ did the
BEST WORK of any Lawn
Mower exhibited.”
ALSO AT
Sydney Exhibition, 1879-80
AND AT
Melbourne Exhibition, '80-1

Opinions of the Press:
“Far superior to any of ours.”—
Vide *The Field*.
“Remarkably easy to work.”—
Vide *Gardeners' Magazine*.
“The quickest, most simple, and
most efficient mower ever used.”—
Vide *Gardeners' Chronicle*.
“We feel bound to recommend it to
our readers as one of the best mowers
we have as yet made acquaintance
with.”—Vide *Floral World*.

How to Grow Tuberous Begonias. Chapters on Raising Seed and every other part of culture. A new and thoroughly revised edition. Post-free, 7d.

Every Amateur and every Gardener as well should read these books. Only to be obtained from **RYDER AND SON, Seed Merchants, Sale, Manchester.**

Estate Sales.

The best County medium for Advertising Sales of Estates is

THE WORCESTER HERALD, the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution, plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the *Worcester Herald*. Specimen copies sent free. Published Friday for Saturday, price 2d. Offices, 72, High Street, Worcester.

Sales of Stock and Agricultural Effects.

THE WORCESTER HERALD is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcestershire. Specimen copies free. Published Friday for Saturday, price 2d. Offices, 72, High Street, Worcester.

Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms to Let, would do well to Advertise in

THE WORCESTER HERALD, the Largest and Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large Circulation, moderate charge. Specimen free. Price 2d. Published Friday for Saturday. Offices, 72, High Street, Worcester.

TO CAPITALISTS.

A NURSERYMAN, with an OLD-ESTABLISHED FIRST-CLASS BUSINESS,

IS IN WANT OF £3000 to £5000,

to further Develop a Largely Increasing Business.—Address, in first instance, Box 32, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

WANTED, a PARTNER (Practical), with Capital, for Nursery Business in Midlothian.—No. 167, KEITH AND CO., Advertising Agents, Edinburgh.

WANTED, a MAN, to take the Management of a Small Nursery, with the assistance of a youth. Glass only. To Grow Roses, Bonardias and Ferns principally for Cut Blooms.—State wages and experience to F. W. HODSON, Groveleigh Nurseries, Retford, Notts.

WANTED, a HEAD WORKING GARDENER, age about 30, energetic. Must have a thorough knowledge of Gardening in all its branches, Vines, Peaches, Melons, Early and Late Forcing, Kitchen and Flower Gardens. State full particulars.—SQUIRE, Messrs. May, 159, Piccadilly, W.

WANTED, a GARDENER, who thoroughly understands Vines, Melons, Wall Fruit and Flowers. Assistance given in work.—State capabilities, character, and wages required, to Mr. CLEAVER, Sittingbourne, Kent.

WANTED, a GARDENER, who understands Vines, Melons, and Wall Fruit. Horse and Cow to attend to.—State character and wages required to Mr. GIBSON, Schamel, Sittingbourne, Kent.

WANTED, a good Man as FLOWER GARDENER—Must be well up to the work (not much carpet work), and strictly sober. Wages 21s., with rise.—W. "Gardener," The Chestnuts, Deomark Hill, Camberwell, S.E.

WANTED, a married Man, about 30 years of age, without family, as UNDER GARDENER, to take charge of Glass. Wife as thorough Laundress.—HEAD GARDENER, Plas Gardens, Dinas Mawddwy, Merionethshire.

WANTED, a FOREMAN. One who thoroughly understands Growing Peaches, Grapes, Strawberries, Melons, Cucumbers, Tomatos and Flowers for Market, and one direct from a Market Garden preferred. If married, must be without family, as the cottage is small.—Application by letter, stating salary required, with copies of testimonials, to MANAGER, Frythesden Gardens, Berkhamstead.

Forest Tree Foreman.

WANTED, IMMEDIATELY, a thoroughly practical and efficient steady, reliable, and obliging MAN.—Apply, stating experience, and where gained, age, salary expected, &c., to Messrs. DICKSONS, Chester.

WANTED, to take Charge of Small Business, experienced GROWER of Cut Flowers, Ferns, Tomatos, Cucumbers for Market.—E. P., Thomas, Hampton, Middlesex.

WANTED, early in July, an energetic and sober young MAN, single, who must be thoroughly competent to assist in Growing Mushrooms for the Market, on the outdoor ridge system. Wages must be moderate.—Apply, giving name and last employer, to W. SERRIENS, Low Gusegate, York.

WANTED, a SHOPMAN accustomed to Boquet and Wreath Making.—Apply, stating wages required and full particulars, to JAS. GARAWAY CO., Durlham Down, Clifton, Bristol.

Seed Trade.

WANTED, IMMEDIATELY, a young MAN as Assistant, who also understands Office Work.—State age, experience, and wages required, to A. G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENING APPOINTMENTS.

Mr. C. HONESS, late of Copped Hall, Totteridge, Herts, has been appointed Gardener to C. COMBE, Esq., Cobham Park, Cobham, Surrey.

Mr. J. VICKERY, for many years Head Gardener at Woodend, Chichester, and Porter's Park, Shenley, Herts, has been appointed Gardener and General Manager to Mrs. KEEN, Cedar House, Herne Hill, S.E.

Mr. W. H. AGGETT has been appointed from the Royal Gardens, Kew, as Head Gardener to J. H. HOPKINSON, Esq., Holmwood, Wimbledon, S.W.

Mr. H. PARRISH, late Foreman at Thorne's House, Wakefield, has been appointed Head Gardener to A. B. SHERIDAN, Esq., Frampton Court, Dorchester.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

HOLLOWAY'S PILLS and OINTMENT.
—Glad Tidings—Some constitutions have a tendency to rheumatism, and are, throughout the year, borne down by its protracted tortures. Let such sufferers bathe the affected parts with warm brine, and afterwards rub in this soothing Ointment. They will find it the best means of lessening their agony, and, assisted by Holloway's Pills, the surest way of overcoming their disease. More need not be said than to request a few days' trial of this safe and soothing treatment, by which the disease will ultimately be completely swept away. Pains that would make a giant shudder are assuaged without difficulty by Holloway's easy and inexpensive remedies, which comfort by moderating the throbbing vessels and calming the excited nerves.

Send for an ILLUSTRATED PRICE LIST of

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

Fig. B.

EXTRACTS FROM TESTIMONIALS.

VILLAGE WATER SUPPLY.

From Mr. THOMAS VARLEY,

Agent to the Trustees of the late William Roundell, Esq., Gledstone Estate, West Marton, Skipton, August 11, 1887.

"DEAR SIR,—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hill-side in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of 2 miles from, and at an elevation of 280 feet above the ram. The water is then gravitated through several pipes and branches, having a total length of about 4 miles, for the supply of the mansion, gardens, stables, estate work-shop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilise the water for other farms. I have much pleasure in being able to report as above."

From J. B. McCALLUM, Esq., C.E.,

Borough and Water Engineer, Blackburn, November 1, 1886. (Borough of Blackburn) Water Supply.

"DEAR SIR,—Following is the short report I promised to send us to the work performed by the Hydraulic Rams—supplied by you to the Blackburn Corporation—after they had been in operation sufficient time to take proper observations.

"The district of Guide—population about 500—in the Borough of Blackburn, is situated above the highest reservoir of the Blackburn Waterworks, and had no regular water supply until last July, when the Water Committee caused two of your Patent Hydraulic Rams to be put down and worked by water from a reservoir having a varying but maximum head of 34 feet 3 inches on the Rams—the waste (clean) water gravitating to a lower adjacent reservoir.

"You contracted to supply rams which would force 8000 gallons per day each through 1295 yards of delivery pipe to a service tank 170 feet above the rams, and I am bound to state that the result has considerably exceeded my expectations, as the rams are capable of pumping, and have pumped, much more water than you promised. The percentage of efficiency exceeds all I expected, and is, in my opinion, much more than is usually obtained from hydraulic rams.

"From a test I made on September 29, I found that two rams with 4-inch and 3-inch strokes respectively, supplied with 191,630 gallons per day, together pumped 26,090 gallons per day to a height of 170 feet, giving 71.43 per cent. of efficiency, and one ram working at 3-inch stroke, and with only 16—18 feet of working fall, supplied with 154,577 gallons per day, pumped 10,587 gallons per day to the same height, showing 72.75 per cent. of efficiency.

"At a subsequent test on October 11, one ram at 3-inch stroke, and having 31 feet 9 inches of working fall supplied with 121,083 gallons per day, pumped 17,583 gallons per day to an elevation of 174 feet, the efficiency in this case being 79.57 per cent.

"In arriving at these results the greatest care was taken to positively measure the water, besides having a meter check on feed and delivery pipes.

"The work carried out by you at Blackburn is substantial and satisfactory in every way, and if any engineer wishes to make his own observations he is at liberty to come here and do so."

From Mr. HENRY ROBINSON,

Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 63 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From Mr. J. A. RUTHERFORD,

Agent to C. F. H. Boleckow, Esq., Estate Office, Marton Hall, Middlesborough, September 26, 1883.

"DEAR SIR,—I am glad to say that the Rams you put down on the Hambledon Estate, for Mr. C. F. H. Boleckow, are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11 gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since.

The Delivery Pipe, in the above case, is 9000 feet in length.

From THOMAS ROBERTS, Esq.,

Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trentham Hall, Staffordshire, April 13, 1886.

"DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Titonour (the residence of the Marquess of Stafford, M.P.) does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 9000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.—I am yours faithfully,

"THOMAS ROBERTS."

From HENRY MORTON, Esq.,

Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 12, 1886.

"DEAR SIR,—The Patent Ram, with 1½ mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Capt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 127 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 800 yards long, with a fall of 70 feet to the service-cocks and fire-plugs at Capt Hewick Hall, where in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

"I consider your method of carrying out the work is everything that could be desired, and whilst the waste-power water from the Ram is less than you specified, the quantity elevated is just what you guaranteed.—I am, dear sir, yours very truly,

"HENRY MORTON."

From WILLIAM DICKINSON, Esq.,

Agent to the Most Honourable the Marquess of Abergavenny, K.G., Eridge Estate Office, Hargate Lodge, Tunbridge Wells, July 3, 1885.

"SIR,—I am instructed by the Marquess of Abergavenny to say that the Patent Hydraulic Ram, with over two miles of pipe, forcing water to a height of 230 feet, which you erected at Eridge Castle about nine months ago, has given his lordship entire satisfaction, and he has every confidence in its continuing to do so.—I am, sir, yours faithfully,

"WILLIAM DICKINSON."

From Captain TOWNSHEND,

Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE, ENGLAND.

SALES BY AUCTION.

Thursday Next.-(Sale No. 7704). VALUABLE ESTABLISHED ORCHIDS, Comprising Choice CYPRIPEDIUMS, &c. MR. J. C. STEVENS will include in his SALE BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 5, a choice Collection of CYPRIPEDIUMS, comprising fine plants of:- Cypripedium Sallieri Hyacinthum v. vexillarium Schroderea splendens Leechii villosum aureum albopurpureum Crossianum superbum chloroneurum boxalli superbum Harrisianum planum Dautleri superbum nitens superbiens Demidoff Waresceyzi &c., &c. Neo-Guineense From a well-known Belgian Amateur. Also some splendid pieces of CYPRIPEDIUM PRESTANS, LISSOCHILUS GIGANTEUS, CATASETUM BUNGEROTHII (true), collected by Mr. Bungehoth; AGANISIA CYANEA, and GALEANDRA GRACILIS (Lindley), by order of L'Horticulture Internationale (Linden) of Brussels. A fine specimen of AERIDES AFFINE SUPERBUM, with aeven growths, in flower; AERIDES LEONII, CYPRIPEDIUM HIKUSTISSIMUM, C. SPICERIANUM, C. MAULEI VIRGINALE, &c. On view morning of Sale, and Catalogues had.

Thursday Next.-(Sale No. 7701). VALUABLE IMPORTATION OF ORCHIDS. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 5, at half past 12 o'Clock precisely, by order of Mr. F. Sander, L.ELIA PURPURATA. A very fine importation just to hand, with fine healthy foliage and dormant eyes, comprising many large masses in good condition; CATTLEYA AMETHYSTINA. Collector describes this as a most superb dark variety, the plants are in very good condition, having many green leaves, and some fine masses are offered; CYPRIPEDIUM SCHLIMM, just received in finest possible condition: the plants offered are as good as established; SOPHRONITES GRANDIFLORA, splendid importation just received in grand order. Collector states that exceptionally fine varieties will be found amongst this consignment-many fine masses are offered. Also fine importations of the following:- CATTLEYA MENDELII, in fine order, CATTLEYA BOWRINGIANA, in fine order, WHITE LELIA ANCEPS, in fine order, ADA ATRANTHA, CATASETUM BUNGEROTHII, CYPRIPEDIUM STONEI, AERIDES FIELDINGII, ONCIDIUM FLEXUOSUM, O. FORBESII, CATTLEYA MOSSIE, ODONTOGLOSSUM CITRIFORMUM, O. NEBULOSUM, O. CERVANTESI, ONCIDIUM CAESIUM, DENDROBES, SACCOLABIUMS, &c. On view morning of Sale, and Catalogues had.

Valuable and Extensive Herbarium. MR. J. C. STEVENS has been favoured with instructions from the Executors of the late John Day, Esq., of High Cross, Tottenham, to include in his SALE BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY July 18, his splendid HERBARIUM, contained in seven well made Pine Cabinets, comprising specimens of Ferns of nearly every known variety. On view morning of Sale, and Catalogues had.

Unique and Valuable Water-colour Drawings of ORCHIDS. MR. J. C. STEVENS has been favoured with instructions from the Executors of the late John Day, Esq., of High Cross, Tottenham, to include in his SALE BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY July 18, the Unique and Valuable Collection of Life-size WATER-COLOUR DRAWINGS OF ORCHIDS, by Durian, contained in 22 bound volumes, together with 41 loose Drawings, and 5 framed, ditto. On view morning of Sale, and Catalogues had.

The Remaining Portion of the Valuable Collection of ORCHIDS formed by the late JOHN DAY, Esq., of Tottenham. MR. J. C. STEVENS begs to announce that he has been favoured with instructions from the Executors of the late John Day, Esq., to SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, July 18, at half-past 12 o'Clock precisely, the Remaining Portion of his valuable COLLECTION OF ORCHIDS, comprising-

Table with 2 columns: Orchid names and descriptions. Includes Odontoglossum Antlersonianum, Wilckeanum, Ruckerianum, Cattleya Warneri, etc.

Special Sale of Orchids in Flower and Bud. MR. J. C. STEVENS begs to announce that his next SALES OF ORCHIDS in FLOWER and BUD will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY and THURSDAY, July 18 and 19, and he will be glad to receive Lists for Catalogues as soon as possible.

Scotland Nurseries, Tansley, Matlock. MR. GEORGE MARSDEN will SELL BY AUCTION, on the "Old English" Hotel, Matlock Bridge, on MONDAY, July 16, 1888, at 5 o'Clock in the afternoon, the old-established and widely known NURSERY, as founded by the late Mr. Joseph Smith, with the residence called Scotland House, and Workman's Cottage, Stables and Appurtenances, situate at Tansley, having a total area of 9a. 1r. 1p. For further particulars, apply to the Auctioneer, Wirksworth; or to the Office of JOSEPH STONE, Solicitor, Wirksworth and Winstler.-June 29, 1888.

Tuesday Next. BRAZILIAN ORCHIDS FOR SALE, WITHOUT RESERVE. MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Sanger & Tropp, to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, July 3, at half-past 2 o'Clock precisely, a splendid lot of LELIA PURPURATA. This importation has arrived in the best possible condition, nearly the whole being compact masses well furnished with leaves; all the plants have finished their growths, while many of them show flower-sheaths which will certainly develop into flowers, together with many other imported BRAZILIAN ORCHIDS, for Sale without reserve. Also a few plants of the rare and beautiful DENDROBIUM MCARTHURII, ODONTOGLOSSUM ASPERSUM and HUMERUM, ONCIDIUM UNDULATUM, CYPRIPEDIUM SCHROEDERIE MORGANÆ, a NEW HYBRID, in bud, &c. The Sale will also include a very fine assortment of well-grown established ORCHIDS. (In view morning of Sale, and Catalogues had.)

Sydenham. Short Notice.-Wednesday next. Unreserved CLEARANCE SALE OF STOVE and GREENHOUSE PLANTS, ORCHIDS, &c., by order of T. Christy, Esq., in consequence of the Gardens being required for building purposes.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, on the Premises, Malvern House, Sydenham, on WEDNESDAY NEXT, July 4, at 12 o'Clock precisely, without reserve, the whole of the well-grown STOVE and GREENHOUSE PLANTS, CROTONS, specimen CAMELLIAS and AZALEAS, two fine specimen LAPIGERIA ALBA and ROSEA, large plants of EUCHARIS AMAZONICA, ODONTOGLOSSUMS, ONCIDIUMS, CYPRIPEDIUMS, CATTLEYAS, and other ORCHIDS, together with a large assortment of ECONOMIC PLANTS, together with a large assortment of ECONOMIC PLANTS. On view the day prior and morning of Sale. Catalogues had on the premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Friday Next. ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM, new variety, Rehb. filis. The whole for Sale without reserve.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. G. T. White to SELL BY AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 6, at half-past 12 o'Clock, precisely, without the least reserve, a fine importation of the new ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM. This variety is described by Professor Reichenbach, who writes as follows:-"I described this curious plant as early as 1876 in Gorch. Linnæ, xlii., page 26. It is also represented in Xenot. Or. hibernæ, ii., tab. 18. It stands in the neighbourhood of Odontoglossum luteo purpureum, but the petals are very acuminate, not edged, and the narrow lip is terminated by an abrupt cuspidate apex in lieu of being blunt or usually bi-lobed, both sepals and petals are usually very rich in dark blackish-brown showing very little yellow. I have just now specimens at hand of a variety with a broader lip. The plant has been found quite isolate at a special spot where there are no other Odontoglossa. Mr. W. Kalbreyer has just brought over living plants, the bulbs are said to be much more like those of Odontoglossum crispum than those of O. luteo-purpureum. The flowers have a most powerful and agreeable smell according to Mr. W. Kalbreyer."

The Sale will also include a fine importation of CATTLEYA SANDERIANA, and a small importation of ODONTOGLOSSUM CRISPUM in splendid condition, together with ODONTOGLOSSUM SPECIES, a very distinct-looking plant from a new district. To these latter plants Mr. G. T. White begs to call attention. On view morning of Sale, and Catalogues had.

Friday Next, July 6. WITHOUT THE SLIGHTEST RESERVE. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Charlesworth, Heaton, Bradford, to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 6, at half-past 12 o'Clock precisely, the following:- The plants are in very fine condition, having been brought home by the Collector. Provisionally named CATTLEYA HENNISIANA. Mr. W. Hennis discovered the plant in an unsearched district, but the flowering season being over, he did not actually see the flowers himself, but was assured on very good authority that the flowers are of a deep yellow colour, the lip having a dark purple centre, with lighter-coloured lines running through the purple. The stout dried flower-spikes prove it to be very floriferous, as many as eight flowers can be counted on them. The growth of the plant is quite distinct from any known Cattleya, the nearest one in habit being Cattleya Skinneri. To assure buyers of Mr. Charlesworth's confidence in the above description, the purchase-money will remain in Messrs. Protheroe & Morris' possession until the plants flower.

1000 ODONTOGLOSSUM VEXILLARIUM. From a description of the collector, who has had a great experience in collecting ordinary Frontino varieties, the plants offered will be found of a superior type, a much larger proportion of dark ones being amongst them; but they vary greatly, some having pure white lips, with very dark sepals and petals. Amongst the latter many flowers will be found with dark rose-coloured veins ranging over the entire lip, producing a quite novel effect. Some flowers measured 4 inches across the lip. Dried flowers will be shown.

CATTLEYA GIGAS, new type. When exploring a remote district Mr. Hennis discovered this remarkably fine variety of gigas, with short stout leaves, and took it at first to be C. Sanderiana; but closer inspection revealed it to be superior in colour, and is very free-flowering, even the smallest bulbs having flowered at home. The plants offered are in capital condition, perfectly dormant and well leaved. The dried flowers will show what a magnificent Cattleya this is. Also CYPRIPEDIUM SCHLIMM, ODONTOGLOSSUM HARRYANUM, ODONTOGLOSSUM LUTEO-PURPUREUM.

The above all in fine condition. Large buyers will find it a good opportunity to secure these varieties. In order that the above without reserve Mr. Charlesworth has confidence the plants will sell on their own merits. On view morning of Sale, and Catalogues had.

Monday, July 9. SPECIAL SALE OF ORCHIDS. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY, July 9, at half-past 12 o'Clock precisely, a quantity of ESTABLISHED ORCHIDS. Amongst those offered for sale are:- Cattleya Gaskelliana alba (true) with sheath Wagneri Reineckiana Rothseebidiana aurea imperialis Cypripedium Calurum Germanyanum Dominianum, with eight growths and two flower-spikes grandis Selligerum majus On view morning of Sale, and Catalogues had.

Table with 2 columns: Orchid names and descriptions. Includes Cypripedium Laurenceanum, Bollea Lalinde, Angreicum Sanderianum, Dendrobium Ainsworthii, Leechianum, nobile Sanderianum, Masdevallia caluria (20 leaves), acrochordia, Reichenbachiana, Infrecta purpurea, Utricularia montana in flower, Zygopetalum aromaticum (3 growths).

The Downside Collection of Orchids. HIGHLY IMPORTANT EIGHT DAYS' SALE of the whole of this renowned Collection, including many plants matchless in point of rarity, and the whole remarkable for culture and condition, embracing unquestionably the most valuable and extensive Collection of ESTABLISHED ORCHIDS ever submitted to Public Competition.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, on the Premises, Downside, Leatherslade, (fifteen minutes' walk from the London and South-Western and the London, Brighton, and South Coast Railway Stations), on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 10, 11, 12, and 13, 1888, at 12 for half-past 12 o'Clock precisely each day, by order of Wm. Lee, Esq., who is Selling the Estate of Downside, and relinquishing the cultivation of Orchids, the First Portion of this extremely valuable Collection of ESTABLISHED ORCHIDS. Amongst the plants included in this First Sale the following may be specially mentioned:-

Table with 2 columns: Cattleya Triane Lezana and Cattleya Triane Vestal. Includes varieties like Dodgsoni, Osmani, Dayana, Emper, Empress, Bäckebousiana, Colemanii, alba, elegantissima, aboracensis superba, regina, implicata major, marginata, Normani, Victoria Regina, bellicosa, magnifica, lilacina, Thomsonii, Rollisoni, beatifica, Archduke, bella, Jamesiana.

and many others not yet named, with their portraits by G. Macfarlane, the whole forming probably the grandest collection of fine varieties of the Triane section ever brought together, many of the plants, moreover, being of the largest size.

Table with 2 columns: Cypripedium amandum and Cattleya Dominiana. Includes varieties like Arthurianum, albopurpureum, euryandrum, lo, Morganiæ, Swanianum, vernixium, selligerum, microchilum, javanicum-superbiens, chloroneurum, cardinale, Crossianum, mammothphyllum, vexillarium, Schroedera, Wunianum, Wallisii, Deudrobium Leechianum, euosum var. leucop-terum, endocharis, rhodostoma, Kingi-num album, nobile nobilium, elegans, arachites, Schroderi, Vande Sanderiana, suavis, Cattleya fansta, calumhata, exoniensis.

MASDEVALLIA SECTION comprises a grand and complete collection of Masdevallias, many of the highest class, and some very rare.

ODONTOGLOSSUM SECTION. There is a large and very choice collection of the finest varieties in large plants, true to name, which have been grown at Downside for several years, and are models of successful cultivation.

PHALÆNOPSIS SECTION. Amongst the Phalænopsis are two plants of P. Brymeriaea, also intermedia, Portei, one of the true variety Dayana, and several leucorrhoda and casta.

The plants may be viewed any day prior to the Sale, on presentation of card to view. Catalogues are now ready, and may be obtained on the Premises, of Mr. WOLFFORD, the Head Gardener; or of the Auctioneers and Valuers, Central Auction Rooms, 67 and 68, Cheapside, London, E.C.

NOTE.-The SECOND SALE will take place on the Premises, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, July 24, 25, 26, and 27.

A List of the principal plants in the entire Sale appeared in the Gardeners' Chronicle on June 9th last.

FRIDAY NEXT. } ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM,
New variety, Rchb. fils. The whole for Sale Without Reserve.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. G. T. WHITE, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 6, at half-past 12 o'Clock precisely, without the least reserve, a fine importation of the new **ODONTOGLOSSUM CUSPIDATUM PLATYGLOSSUM.**

This variety is described by Professor Reichenbach, who writes as follows:—"I described this curious plant as early as 1876 in *Garika Linnae*, xli., page 26. It is also represented in *Xenia Orchidaceae*, ii., tab. 18. It stands in the neighbourhood of *Odontoglossum luteo-purpureum*, but the petals are very acuminate and not edged, and the narrow lip is terminated by an abrupt cuspidate apex in lieu of being blunt or usually bi-lobe. Both sepals and petals are usually very rich in dark blackish-brown, showing very little yellow. I have just now specimens at hand of a variety with a broader lip. The plant has been found quite isolate at a special spot, where there are no other *Odontoglossae*. Mr. W. Kalbreyer has just brought over living plants. The bulbs are said to be much more like those of *Odontoglossum crispum* than those of *O. luteo-purpureum*. The flowers have a most powerful and agreeable smell according to Mr. W. Kalbreyer."

The Sale will also include a fine importation of **CATTLAYA SANDERIANA** and a small importation of **ODONTOGLOSSUM CRISPUM** in splendid condition, together with **ODONTOGLOSSUM SPECIES**, a very distinct-looking plant from a new district. To these latter plants Mr. G. T. White begs to call special attention.
On view morning of Sale, and Catalogues had.

FRIDAY NEXT, JULY 6.—WITHOUT THE SLIGHTEST RESERVE.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. CHARLESWORTH, Heaton, Bradford, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 6, at half-past 12 o'Clock precisely the following. The plants are in very fine condition, having been brought home by the Collector:—

NEW CATTLEYA.

Provisionally named **CATTLEYA HENNISIANA.**

Mr. W. Hennis discovered the plant in an unsearched district, but the flowering season being over, he did not actually see the flowers himself, but was assured on very good authority that the flowers are of a deep yellow colour, the lip having a dark purple centre, with lighter-coloured lines running through the purple. The stout dried flower-spikes prove it to be very floriferous, as many as eight flowers can be counted on them. The growth of the plant is quite distinct from any known *Cattleya*, the nearest one in habit being *Cattleya Skinneri*. To assure buyers of Mr. Charlesworth's confidence in the above description, the purchase-money will remain in Messrs. Protheroe & Morris' possession until the plants flower.

In offering the above, Without Reserve, Mr. Charlesworth has confidence the plants will sell on their own merits.

On view the morning of Sale and Catalogues had.

1000 ODONTOGLOSSUM VEXILLARIUM.

From a description of the collector, who has had a great experience in collecting ordinary *Frontino* varieties, the plants offered will be found of a superior type, a much larger proportion of dark ones being amongst them; but they vary greatly, some having pure white lips, with very dark sepals and petals. Amongst the latter many flowers will be found with dark rose-coloured veins running over the entire lip, producing a quite novel effect. Some flowers measured 4 inches across the lip. Dried flowers will be shown.

CATTLEYA CIGAS, NEW TYPE.

When exploring a remote district Mr. Hennis discovered this remarkably fine variety of *Cigas*, with short stout leaves, and took it at first to be *C. Sanderianum*; but closer inspection revealed it to be superior in colour, and is very free-flowering, even the smallest bulbs having flowered at home. The plants offered are in capital condition, perfectly dormant and well leaved. The dried flowers will show what a magnificent *Cattleya* this is. Also

CYPRIPEDIUM SCHLIMMI.
ODONTOGLOSSUM HARRYANUM.
ODONTOGLOSSUM LUTEO-PURPUREUM.

The above all in fine condition. Large buyers will find it a good opportunity to secure these varieties.

Havant.

FIRST ANNUAL SUMMER SALE.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Ewing & Co. to SELL by AUCTION, on the Premises, the Sea View Nurseries, Havant, on WEDNESDAY, July 11, at 12 o'Clock precisely, 5000 TEA, NOISETTE, and other ROSES in pots; 2000 IVIES of the choicest green leaved and variegated kinds, 1000 AMPELOPIS VEITCHII, and other VIRGINIA CREEPERS; a large quantity of Hardy PASSION FLOWERS, including the new White Constance Elliott; Japanese and other HARDY EVERGREENS, choice flowering and foliaged TREES and SHRUBS, Hardy CLIMBING PLANTS, &c., all in pots suitable for immediate removal.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises, at the principal Hotels in the district, and of the Auctioneers, 67 and 68, Cheapside, E.C., and Leytonstone.

Friday, July 20.

Important SALE of the whole of the COLLECTION of ESTABLISHED ORCHIDS (excepting the Cool-house ORCHIDS), by order of the Executors of the late H. Littleton, Esq., of Westwood House, Sydenham, without reserve.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, July 20, at half-past 12 o'Clock precisely, without reserve, the COLLECTION of ESTABLISHED ORCHIDS, formed by the late H. Littleton, Esq. (except the Cool-house ORCHIDS), including fine specimen *Pescatorea Lehmanni*, several fine *Vandas*; about 200 *Cattleyas*, including *Gigaris*, *labiata*, *Mendeli*, *Mossie*, *Triaue*, and others; fine pieces of *Odontoglossum*, *Uro-Skinneri*, *Inselnyi*, *Leopoldianum*, and *Londesboroughianum*; several large *Cologyne cristata*, *Cypridium venustum*, *velosum*, *hirsutissimum*, *caudatum*, and others; fine piece of *Epidendrum prismatocarpum*; specimen *Cymbidium eburneum* and *Parishii*; *Aerides* and *Dendrobis* in variety; a fine lot of *Cypridium niveum*, and *Calanthe Veitchii Phalaenopsis*; also twelve fine specimen *Encharris amazonica*, in splendid health, and four *Panacrum fragrans*.
On view morning of Sale, and Catalogues had.

Monday, July 23.—Special Sales of Orchids.

MESSRS. PROTHEROE AND MORRIS beg to give notice that they will SELL, by order of Mr. F. Sander, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on the above date, large quantities of Imported and Established ORCHIDS.

Further particulars will be announced.

Friday, August 17.

The remaining portion of the valuable Collection of Established ORCHIDS, formed by F. A. Philbrick, Esq., Q.C., of Oldfield, Bickley.

MESSRS. PROTHEROE AND MORRIS beg to give notice that they will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, August 17.

Further particulars will appear.

Nurserymen, Florists, and Gardeners.

FOR SALE (through dissolution of partnership), the BLACKBATH NURSERIES, a going concern, in the centre of a wealthy residential neighbourhood, 7 miles from Covent Garden. The long Lease of a compact well-established Nursery of 2 acres, with Stand in Covent Garden Floral Market, 6 Greenhouses, 125 by 13 feet; and 1 House, 105 by 30 feet; all exceptionally well built and heated. A good jobbing business could also be done.
Apply, R. J. SUTER, 6, Eastcombe Terrace, Blackheath.

TO BE DISPOSED OF, a FLORIST'S and SEED BUSINESS, near an important town in the South of England. An excellent opportunity for a persevering man with small capital. For particulars apply to A. Mr. Fry, South Western Hotel, Micheldever, Hants.

TO BE SOLD (a rare opportunity), a Valuable and most eligible FREEHOLD and FLORIST'S NURSERY. The property is pleasantly situated on a main road about 2 miles out of Leicester—which is one of the most thriving manufacturing towns in the Midlands—in a good locality. It consists of three (red brick and slated) well-built bay-windowed Villa Residences, containing eight rooms and two cellars each, with Gas and Water, at the rear of which are seven large Glasshouses (numerous Pits and Outhouses) heated by hot-water. Superficial Area of Glass, over 4000 feet. All in good state of repair. Also a large Garden, with river frontage, well stocked with Fruit Trees in full profit. The whole standing on about 2600 square yards of Land, and bringing in a rental of £26 per annum. Stock low.
For further particulars apply on the Premises to the owner, Mr. S. WALKER, Aylestone Park, Leicester; or HARRISON AND SONS, Market Place, Leicester.

TO BE SOLD, a MARKET NURSERY, 2½ Acres, as a going concern. Glass, &c., in good condition. Rent low. All at Roses a speciality. Ten miles from Covent Garden. Splendid opportunity.
A. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

Gardeners, Nurserymen, and Others.

THE LEASE of a compact NURSERY, situated in the heart of a fashionable wealthy West end neighbourhood, comprising 7 Greenhouses, Stabling, Foreman's Cottage, Cart Sheds, about an acre of Ground, held for a long unexpired term, at the low rental of £50.
Price £15 or offer.

HERBERT DRAKE, 343, Harrow Road, Paddington, W.

To Florists and Small Capitalists

Seeking a pleasant and remunerative occupation. **T**HE LEASE and GOODWILL of a well-established BUSINESS, successfully carried on for over 50 years, the present owner retiring. Every investigation counted in personal application. Price £300, Stock at valuation.
W. A. CLINGO, Nurseryman and Florist, 18, Finchley Road St. John's Wood, N.W.

Durant's Arbour Estate, Ponder's End, Middlesex.

TO BE LET, on Lease, for 21, 60, or 80 years, 1 to 50 acres of excellent MEADOW LAND, from £8 to £11 per acre, with the option of the purchase of the freehold within the first 9 years. No title or land tax.
Apply to A. AND G. GUIVER, Land Agents, &c., Ponder's End, N.B. Several Nurseries established on the estate.

TO BE LET, 1 to 10 acres of GRASS LAND, on Lease for 7, 14, or 21 years. Rent from £8 to £12 per acre, with the option of purchase of the freehold within the first 7 years. Near the main road Enfield Highway, about 9 miles from London.
Apply, H. MOORE, 59, Bishopsgate Street Within, E.C.

TO BE LET, from Michaelmas next, but may be entered upon at once, a small compact NURSERY, containing 9 Greenhouses, 6-room Cottage, Stable, Sheds, &c., in all about an acre. Situate N.W., within 5 miles of Covent Garden. Rent £32. Small stock at valuation.
Address, Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

TO LET, an Old-established SEED, MARKET GARDENER and FLORIST'S BUSINESS. Several good Greenhouses. Good position in good Market Town. Excellent opportunity for energetic business man. Can be seen any time.—J. F., *Gardeners' Chronicle* Office, 1, Wellington Street, Strand, W. C.

ECONOMIC BOTANY.*

UNDER the above title the Royal Botanic Society of London has recently published in their Quarterly Record for January, February, and March an essay, for which the Council awarded the Jubilee prize of a Gold Medal and fifty guineas offered by the Society last year.

Considering the value of the prize, the interest of the subject, the immense resources available to one capable of dealing with them, we were led to expect, as the result of the Society's offer, some really useful contribution to Economic Botany, useful alike to commercial men as well as to botanists, and we were interested in seeing what would be the result of this offer on the part of a Society, Botanical in name, but in not much besides. In these matters, however, we are grievously disappointed, for we do not hesitate to say, that the Essay to which the Council has awarded the prize will be of no use whatever to either class.

The author classifies his subjects under the following eight heads:—Textile Materials, Materials for the Manufacture of Paper, Gun-cotton and its Derivatives, Materials used in Dyeing and Tanning, Gutta-percha and other Commercial "Gums," Vegetable Oils and Fats, Foods and Beverages, Timber.

Under the first heading—namely, Textiles—we look in vain for any adequate mention of Jute, which has made such rapid strides as a commercial article in this country, and has given to Dundee a notoriety besides that for making marmalade. In 1846 only 9300 tons of Jute were imported into this country, while in 1886 the imports had risen to 267,724 tons. At first

* Fifty Years of Economic Botany: an Essay upon the Vegetable Substances introduced into Britain for Use in the Arts and Manufactures, and as Food, during the reign of Her Majesty Queen Victoria. By John W. Ellis, L.R.C.P.

Jute was used only for mixing with wools in cheap druggets and carpets; now it is applied to a great variety of purposes, such as imitation tapestry, and even for mixing with cheap silks, to which it lends itself on account of its bright glossy appearance. These, then, are the primary uses of Jute with us, and not alone as a paper material, to which a short paragraph only is given in the Prize Essay.

Why Gomuti fibre, Piassava, or Bass and Coir, should be included among textiles is beyond our comprehension. The first is described as "the produce of the Sago Palm (*Saguerns saccharifer*)." This is incorrect, for the Sago Palm is *Metroxylon sagn*, Rottb.; *Arenga saccharifera*, however—the Gomuti Palm—does yield a small proportion of Sago from its stem, in the same way that some other Palms do. The fibre which is obtained from the sheathing base of the leaves is almost as stiff as Bass itself, and is only used in India for the coarsest kind of ropes or cables. Piassava, or Bass, is disposed of in a very brief paragraph. The author refers to it as the produce of *Attalea funifera* of Brazil; he is apparently unaware that two qualities are known in commerce under the names of Bahia and Peria Piassava—the first from *Attalea funifera*, and the second from *Leopoldinia Piassava*. The only reason for including Coir amongst textiles seems to be its application for making the well known cocoa-nut matting.

Pita fibre, or Silk-grass, is said to be "manufactured from a plant belonging to the N. O. Bromeliaceae, probably *Nitidularium* (*Bromelia*) karatas." We suppose *Nitidularium* is here intended, but the plant referred to is more correctly Karatas Plumieri, E. Morren. It may interest the author to know that the short, flossy fibre from the seeds of *Calotropis gigantea* (p. 141) was experimented upon not many years since. Messrs. Thresher & Glenny, the well-known hosiers, tried it in weaving socks. It was found, however, to have neither staple nor strength. The prospect of its being used as a textile is extremely small.

We have not space to point out the numerous errors in botanical nomenclature that occur throughout the whole Essay, but we will content ourselves with supplying a few omissions of a very important character from a long list that we might readily give. Amongst paper materials, for instance, we look in vain for *Yucca brevifolia*, *Broussonetia papyrifera*, *Pollinia diapoda*, *Uniola virgata*, and others. Our readers will well remember that all these have been brought into use during the past few years, and particular prominence given to *Yucca brevifolia*, as being the source for some time of the paper used by the *Daily Telegraph*.

Caoutchouc, which has played such an important part in the telegraphy and telephony of the world, is dismissed very briefly without a note of what has been done at Kew in the wide diffusion of Caoutchouc-yielding plants over the face of the globe; while not a single scientific name of any of the African or Eastern species is mentioned.

Some of the most important omissions, however, are in the chapter on oils and fats. Cotton seed oil is not referred to, although the trade in this oil has increased enormously within the last five years, and although its refinement has been carried to such perfection that it is even substituted in France for Olive oil. A long list of oil seeds might be given which have not even a passing allusion in the Essay. A few will suffice:—*Telfairia occidentalis*, *Myristica angolensis*, M.

surinamensis, *M. guatemalensis*, *Hyptis spicigera*, *Polygala rarifolia*, *Lophira alata*, &c.

Under fruits and vegetables, though preserved fruits are referred to, not a word is said about what was done at the Colonial and Indian Exhibition in 1886, when this source of food was brought more prominently to notice than at any other period of history. Still more notable, perhaps, is the absence from the Essay of any mention of the subject of drugs. Not a single reference is given to *Cinchonas*, the acclimatisation of which has proved of such vast benefit to the human race; nor is there the slightest allusion to the countless new drugs introduced during the period under review. The want of an index completes the inefficiency of a Prize Essay which reflects little credit on a society which claims to be a botanical society and none at all on the judges it appointed to make the award.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM BERGGRENIANUM ×, n. *hyb.*

This is stated to be a cross between *Cypridium Dauthieri* and *C. insigne*. Which was the pollen parent is unknown, but probably *C. Dauthieri*. Mr. Sander, the possessor, wishes it named in honour of his assiduous traveller, Mr. Berggren. Leaves ligulate acute, light garlic-green, with very sparse and thin-lined tessellations above, but simply green underneath. The flower is almost like that of *C. Dauthieri* Rossianum. There is no green space at the top of the upper sepal. The dark Indian-purple nerves stand on a light purple ground. A large space at the base with a few Indian-purple spots; lower sepal lightest green; the darker green nerves are covered with broken Indian-purple lines. Petals those of *C. Dauthieri*, dark purple, the inferior space at the base yellowish, with dark green spots, ciliate on the margins at the base. Lip of *C. Dauthieri*. Staminate trilobed-forcipate, orange, very distinct from that of *C. Dauthieri*. Bracts very short, green, with an Indian-purple tinge. Peduncle dark Indian-purple. *H. G. Rehb. f.*

CATLEYA LABIATA (MOSSIE), Lindl., MR. T. LANGE'S VARIETY.

This choice specimen is very like Mr. S. Courtauld's form (see p. 681). The lip, however, is distinct. Its anterior blade is rose-coloured, with broad, dark purple lines on a rose ground. At the base there are two rows of short, diverging, brownish lines. The sides are rose-coloured. Radiating orange lines diverge on either side of the centre. It was kindly sent me by Mr. T. Lange, of Heathfield, Gateshead-on-Tyne. *H. G. Rehb., f.*

ANGULOIA INTERMEDIA ×, n. *hyb.*

This is a new hybrid, raised by Mr. Seden between *Anguloia Clowesii* and *A. Ruckeri*, the former being the seed parent. It was exhibited by Messrs. James Veitch & Sons at a recent meeting of the Royal Horticultural Society, and also at the Linnean Society's centenary on May 25. The two parent species do not differ from each other in any very important details except colour, *A. Clowesii* being bright yellow, while *A. Ruckeri* is heavily marked and blotched with crimson on a light ground. The hybrid partakes most of the characters of the latter, the segments being pale honey-coloured, densely spotted with light rosy-purple. The spots on the sepals are minute, very dense, and somewhat confluent, into a kind of irregular pattern. On the petals they are larger, a little darker in colour, and more distinct. The lip is almost suffused with shiny cinnamon-brown, the disc being paler, and with a few transverse purple bars. It is thus an interesting addition to the cultivated forms of this small but interesting genus. The Messrs. Veitch inform me that this is not the first hybrid *Anguloia* raised arti-

cially, one having been produced a few years ago by Mr. J. C. Bowring, of Forest Farm, near Windsor. This plant, however, is believed to have died shortly after flowering, and, therefore, the present one is probably the only hybrid *Anguloia* in existence. Whether Mr. Bowring's hybrid ever received a name I am unable to say; nor do I know whether its parentage was the same as that of the present one. *R. A. Rolfe.*

HARDY EUCALYPTI IN INDIA AND ELSEWHERE.

THE accurate determination of these plants is a matter of such importance practically, that we trust we may be rendering a service by further alluding to the subject. We have already figured the species which are most hardy in this country, but as the plants, or some of them, vary very greatly at different stages of their growth, and botanists have often had to pronounce an opinion upon imperfect specimens, it is no matter for surprise that considerable differences of opinion should have arisen.

E. URNIGERA.

The hardiest of all seems to be *E. urnigera*, as grown at Whittinghame, East Lothian. The correctness of our identification of this species was questioned—as we expected it would be—because others, more competent than ourselves, had in former years given a different verdict. That verdict, however, was given upon much less complete evidence than we had the advantage of weighing, and in point of fact, the evidence Mr. Garrett was good enough to place before us has put the matter beyond all doubt. In so saying we have the powerful support of our excellent friend, M. Naudin, whose competency will not be denied, and who has made a special study of the genus, basing his observations on the study in all stages of their growth of a series of these fine plants under cultivation in the Villa Thuret, at Antibe. M. Naudin points out that in *E. uringera* the young leaves differ from those on the older plants; thus, the young leaves are opposite, sessile, orbicular, and green; while the leaves on the adult plant are alternate, stalked, oblong, or elliptic, always green, never glaucous, and the flowers usually in groups of three. We are now enabled, thanks to M. Naudin's courtesy, to figure the young foliage of *E. urnigera* (A, in fig. 108, p. 799), and, for the better illustration of the species, repeat the figure of the adult foliage, flower, and characteristic fruit (fig. 110, p. 802). At p. 460 of the present volume will be found the interesting account of the tree at Whittinghame, and in a subsequent number (p. 595) the comments of Dr. Landsborough.

E. COCCIFERA.

To this species belongs the fine tree at Powderham Castle, figured in these columns in vol. xii. (1879), p. 113. In this species also, as pointed out by M. Naudin, the leaves are of two forms. In the young state they are opposite, sessile, oval, and more or less mucronulate; in the adult form they are alternate stalked, lance-shaped, often mucronate, the point or mucro being often curved, like a hook. The young branches are cylindrical and very white, and the flowers usually in tufts of seven. M. Naudin has also kindly enabled us to give an illustration of the young foliage (B, in fig. 108, p. 799), and to enable the reader to compare it with the adult foliage we repeat the figure of *E. coccifera* previously given (fig. 109, p. 801).

E. COEDATA.

Lastly, there is *E. cordata*, which we mention because it has been much mixed up by other observers by reason of the great similarity of its foliage to that of some other species. *E. cordata*, says M. Naudin, has the young shoots four-sided, leaves always of the same general character, opposite, sessile (even in the adult stage), covered with whitish meal when young, but glabrous, greyish, or flushed with red as the tree increases in age. The flowers are borne in tufts of three. Fruits almost hemispherical, flattened at the top. The

figure 111, on p. 803, is taken from a specimen sent us by M. Naudin.

E. cordata is noted by Baron Von Mueller, the historian of the Eucalypt, as the dwarfest but one of all the species, and, as will be gleaned from what has been said, it is usually very distinct from *E. urnigera*, when seen in the adult fruit-bearing state; nevertheless there are, according to Baron Von Mueller, intermediate varieties linking the two species together. But even if this be so, for purposes of cultivation, it is best to keep the two distinct.

CULTURAL MEMORANDA.

CYCLAMENS IN SUMMER AND AUTUMN.

Young plants that were raised last October should by this time have made fine corms; they should be

side out-of-doors, until new growth commences. They should then be shaken out and repotted, using a similar material to that above described. Remove them inside and keep close for a few days and slightly shaded, very little water will be required until they begin to emit new roots. One of our largest London growers once informed me that it was a great benefit to the plants in autumn, after maturing their growth, to remove the lights altogether at night, for a few weeks, to allow the dew to fall upon the foliage, as greater substance and strength was ensured by so doing, but of course this should only be done on warm nights, otherwise, instead of proving a benefit, it would be really injurious. *J. G.*

SOLANUM JASMINOIDES.

This desirable climbing plant is propagated by means of cuttings from the young growths, which should be inserted in small pots filled with a soil

of the other. This most desirable *Phlox* is said to have been raised by the late Mr. Nelson, of Aldborough, and is no doubt a seedling from *P. subulata*, as this kind gives much variety of colour when plants are raised from it in that way, and there are now many named sorts that have so originated. All these procumbent *Phloxes* do well in almost any ordinary garden soil, but they succeed best where they can have a cool root-run, and as they spread quickly they may soon be increased by division, the season for doing this being just as the plants start growth in the spring. If seed is to be sown, that is best done in finely sifted soil, pressed firm and watered before the sowing, when it should be covered with a handlight and kept dark, or shaded closely, till the seed germinates. *J. S.*

TRACHELOSPERMUM JASMINOIDES (RHYNCHOSPERMUM).

There is not a more desirable plant for pillars in the greenhouse or conservatory at this time of year than this well-known plant, whose fragrant flowers are so much admired and useful for so many purposes. Owing to the milky sap of the cut shoots flowing away readily, it is of importance that this be stopped, so as to preserve the freshness of the flowers as long as possible, and that may be done by pressing the end of the shoot on a hot cinder for two seconds. The same treatment holds good for *Mandevilla* and *Poinsettia*. The plant may be propagated by cuttings taken in spring, when it is making its growth; these should be put into pots of sandy peat and loam, which may be placed under a handlight in the stove, or in a propagating frame without the handlight. Good bottom-heat is necessary for successful striking. When struck, pot off into small pots and grow on in a frame till they attain a size large enough to be planted out in a well prepared border or tub. *G. H. Merton.*

PLANTS CERTIFICATED

DURING THE HALF YEAR ENDING JUNE 30, 1888, BY THE ROYAL HORTICULTURAL SOCIETY.

The following received First-class Certificates:—

<i>Abutilon vitifolium</i> ...	Kelway, May 22.
<i>Aërides Fieldingii</i> alba ...	Baron Schroder, May 22.
<i>Aisne verna</i> plenissima ...	Roebel & Co., May 22.
<i>Amaryllis Conqueror</i> ...	Veitch, April 10.
.. Emperor Frederick ...	Williams, April 10.
.. Finette ...	Veitch, April 10.
.. Miss Anslie ...	Kelway, April 24.
.. Miss Roberts ...	Veitch, April 10.
.. Rodney ...	Veitch, April 10.
<i>Anemone ap-ninia</i> alba ...	Ware, May 8.
<i>Angrecum arcuatum</i> ...	Buchan, April 24.
<i>Sauvorianum</i> ...	Sander, Jan. 19.
<i>Angulou intermedia</i> x ...	Veitch, May 22.
<i>Anthurium Desmetianum</i> ...	Linden, June 12.
<i>Ardisia mamillata</i> ...	Veitch, Feb. 14.
<i>Arnebia echioides</i> ...	Paul & Son, May 22.
<i>Auricula</i> (alpine) Hetty Dean ...	R Dean, May 8.
.. Mr. Harry Turner ...	Turner, May 8.
.. Mrs. Harry Turner ...	Turner, May 8.
<i>Azalea Baron Rothschild</i> ...	Turner, May 8.
<i>Begonia Baron Rothschild</i> ...	Laing, May 22.
.. <i>Caecilia</i> ...	Laing, June 12.
.. H. Adcock ...	Laing, June 12.
.. Mr. W. B. Miller ...	Cannell, June 12.
.. Princess Maud ...	Laing, May 22.
<i>Bignonia Tweediana</i> ...	Ross, April 10.
<i>Cesalpinia japonica</i> ...	Veitch, June 26.
<i>Caladium Comte de Germiny</i> ...	Laing, May 22.
<i>Calochortus venustus</i> var. <i>citrimus</i> ...	Ware, June 26.
<i>Carnation</i> (tree) Mrs. W. H. Greenfell ...	Turner, April 10.
.. phyllis ...	Turner, Feb. 14.
.. Purple King ...	Turner, April 10.
<i>Cattleya Wagon superba</i> ...	Baron Schroder, June 12.
<i>Cineraria Adnanca</i> ...	Cannell, April 24.
.. <i>Alysia</i> ...	Cannell, April 24.
.. Beatrice Kelway ...	Kelway, April 24.
.. Faust ...	Cannell, April 21.
.. Marie ...	James, April 10.
.. Queen Victoria ...	Kelway, April 24.
<i>Cordyline australis</i> variegata ...	Williams, April 10.
<i>Cypripedium bellatulum</i> ...	Low, May 22.
.. <i>bellatulum roseum</i> ...	Low, May 22.
.. <i>Tantzenum</i> ...	Tantzen, Jan. 19.
<i>Daphniphyllum glaucescens</i> ...	Veitch, June 26.
<i>Delphinium Bussoni</i> ...	Kelway, June 26.
.. <i>Figaro</i> ...	Kelway, June 26.
<i>Dendrobium chryso-eburneum</i> ...	Sir T. Lawrence, Feb. 14.
.. <i>crastitudo superbum</i> ...	Sir T. Lawrence, March 27.
.. <i>nobile Cooksoni</i> ...	Sir T. Lawrence, Feb. 14.
.. <i>splendissimum</i> var. <i>grandiflora</i> ...	Baron Schroder, March 27.
<i>Disa racemosa</i> ...	Kew, May 22.
<i>Erythronium grandiflorum</i> albidiflorum ...	Ware, April 24.
<i>Epideprum atro-purpureum</i> ...	Sir T. Lawrence, June 26.
.. <i>O'Brienium</i> x ...	Veitch, May 22.

FIG. 108.—YOUNG FOLIAE OF—A, EUCALYPTUS URNIGERA, AND, B, EUCALYPTUS COCCIFERA. (SEE P. 798.)

thoroughly looked after, for should they receive a check in any way, failure will result. Pot on as soon as the pots become full of roots, employing two parts of good fibrous loam and one of leaf-mould, or well decayed manure, adding a little silver-sand to keep it porous. Plants if properly attended to should commence to bloom in the early part of November, and continue to do so for at least three or four months. Our earliest batch we grow in 48's, and some of these had as many as forty fully expanded blooms on a plant in the first week in November. Old plants that have done blooming should have been removed from the flowering house to some light airy pit, where they can be properly looked after, but unfortunately many have an idea that after their beauty is gone, they can be stacked away anywhere so long as they are out of sight. Old plants intended to flower another season, and which have hitherto, been looked after, must be carefully attended to for a short time longer to mature and develop the crown buds, after which water must be gradually withheld to give them a rest; they can be otherwise kept in a pit, or laid on their

consisting of three parts light sandy loam and one of leaf-mould, and plunged in a gentle bottom-heat, keeping them close until rooted, when they should be potted off into 3-inch pots, and grown on. Young plants may also be raised from seed sown thinly in pots, afterwards treating the seedlings as above indicated. In the lofty and elegant conservatory attached to Watermouth Castle, near Ilfracombe, a plant of this white and sweetly-scented greenhouse perennial is in grand flower, the flowering shoots hanging loosely from the roof. *H. W. W.*

PROCUMBENT PHLOXES.

These are very desirable plants to grow on mounds or banks, or in the front of borders, or on elevated spots in the rock garden, where they can trail over, for which purpose their habit suits them, and when so placed they are very effective. The most striking with us has been *P. Nelsoni*, which has been a mass of white colour, and a very conspicuous object for some time, as it has shown in contrast with *Daphne cneorum*, the pink blossoms of the one helping to set off those

<i>Eulalia japonica gracillima</i> ...	Veitch, June 26.
<i>Haberlea rhodopensis</i> ...	Kew, May 22.

PLANT NOTES.

STREPTOCARPUS PARVIFLORA.

The plant figured in the *Botanical Magazine* under this name is *S. lutea*, which differs from the true *S. parviflora* in having longer and narrower leaves, with more petiolate bases, fewer hairs, and a greener colour. The true *S. parviflora* is now in flower in the Succulent-house (No. 5) at Kew. It was raised from seeds collected in Grahamstown, where it is common in rocky places. Curiously enough this plant, which is a pretty subject for pots, has not previously been in cultivation, nor is there a figure of it anywhere. The flowers are like those of an Achimenes in shape, the tube being narrow, three-quarters of an inch long, and the limb flat and spreading, 1 inch across. Colour white and violet on the outside, paler inside. The scape is similar to that of *S. lutea* (*parviflora* of gardens). *W.*

CHIRONIA PEDUNCULARIS.

This is one of the handsomest of the Chironias, and, moreover, one which is very easily cultivated. In habit it is like that of an *Exacum*; the leaves are large, three-nerved, and sessile, and the flowers are borne profusely in terminal branching racemes, each flower having a long thin stalk. In form the flowers resemble *Exacum macranthum*, but they are not

quite so large, whilst the colour is rosy-purple. There is a poor figure of it in the *Botanical Register*, xxi., 1803, and another in *Paxton's Magazine*, 1836, under the name of *C. trinervis*. Lindley states that nothing was known of the country nor history of this plant, which was in cultivation in London nurseries in 1835. It is a native of the Cape. Plants of it may now be seen in flower in the Cape-house at Kew. They were raised from seeds brought from Grahamstown a year ago. *W.*

NYMPLÆA ZANZIBARENENSIS FLORE-RUBRO, N. OERTGIESIANA VAR. ADELE; AND N. SCUTIFOLIA ROSEA.

Under these three names there are three plants in the collection at Kew which are in flower, and which are not distinguishable from each other. The first-named came from Karlsruhe, reputedly as a cross between *N. zanzibarenensis* and *N. dentata*; the second came through seeds from Palermo, as already noted in the *Gardeners' Chronicle*; and the third was obtained from Glasgow. Whatever the origin of the plant which has somehow been named three times, it is certainly a variety of the well known African species, *N. stellata*, and so far as I can make out it is the form which has been named *N. stellata* var. *purpurea*. The flowers are 5 inches across, and a pale mauve-purple with purple filaments and yellow anthers. It is a distinct and pretty Water Lily. The flowers open before noon and remain expanded till evening. *W. W.*

IRIS DOUGLASSIANA.

At Mr. Ware's nursery, Tottenham, there is now in bloom the pretty but rare *Iris Douglasiana*. It has a creeping rhizome about as thick as the little finger; leaves about a foot long and 1½ inch broad; the flowers are rosy-lilac, the exterior divisions being creamy-white, towards the base yellow, with spots and veins of a rosy-purple. The plant is of easy culture, but requires a sheltered position.

ORCHID NOTES AND GLEANINGS.

LÆLIA MAJALIS.

In speaking of this species, at p. 717, as one of the best of its kind, Mr. Ashton does it no more than justice, although perhaps our appreciation of the beauty of its flowers is heightened by the fact of our seeing them so seldom. I have had the charge of a few plants for several seasons past, and although each autumn they were exposed to the light in the manner Mr. Ashton suggests, in order to ripen off the pseudobulbs, such treatment did not induce them to flower. Last August, however, when the growth was finishing, several plants were placed out-of-doors, being hung on a shrub against a south wall; here they stayed for six or eight weeks. Owing most probably to the maximum amount of light and fresh air they thus obtained, we have been rewarded this summer by their flowering. One plant, just over, bore a flower measuring 7 inches across. Except in the matter of flowering, no difficulty attends the cultivation of this *Lælia*; our plants produce pseudobulbs as large as the imported ones. When once they have fairly commenced growing, it is best to let them have abundance of warmth and moisture; by so doing their growth is completed more rapidly, and there is a longer time allowed in which to ripen it. *W. B.*

LÆLIA ANCEPS VAR. STELLA.

The treatment recommended for these plants is to place them in an intermediate or Cattleya-house, fully exposed to the sun. They are kept very damp during the growing season. Warner and Williams' *Orchid Album*, t. 329. See *Gardeners' Chronicle*, February 26, 1887.

MORMODES PARDINUM.

For these plants Mr. Williams recommends cultivation in the East India-house during the growing period, in good fibrous peat, in well drained pots. When growth is finished water is withheld and the plant kept close to the glass in an intermediate house. Warner and Williams' *Orchid Album*, t. 330.

LÆLIA ELEOANS MORRENIANA.

A magnificent variety which adds fragrance to

the other charms of its flowers. The plant requires abundance of heat, free exposure to light, but shade from direct sun, and abundance of water when growing. Warner and Williams' *Orchid Album*, t. 331.

DENDROBIUM KINGIANUM VAR. *ALBA*.

This differs from the type in its white flowers, which are produced from February to March. Like the typical plant, it should be grown in a pot or hanging basket, using fibrous peat and sphagnum for it to grow in. A moderate supply of water should be given during the growing season, which commences immediately after the flowers have faded. After the

TREES AND SHRUBS.

ORNAMENTAL SHRUBS.

From the Royal Botanic Garden, Edinburgh, we have received specimens of the three following shrubs:—

Olearia Gunniana.—A hardy evergreen Composite shrub, remarkable for the profusion with which its starry white flower-heads are produced. The leaves measure rather less than 1 inch in length by a quarter of an inch in breadth, being

pinkish-orange, with the limb dividing into five oblong-obtuse yellowish lobes. The shrub is a native of the Eastern Himalayas, at elevations of 10,000—12,000 feet, where it was originally discovered by Sir Joseph Hooker. Mr. C. B. Clarke, in Hooker's *Flora of British India*, refers to this species as synonymous, or varietal *R. Roylei* and *landfordiaeflorum*, and states that it is of very variable character.

Discaria Toumata.—A straggling, Rhamnaceous shrub, of formidable appearance owing to the long straight, regularly-disposed spines with which it is

FIG. 109.—ADULT FOLIAGE OF *EUCALYPTUS COCCIFERA*. (SEE P. 798.)

growth is completed, just sufficient moisture should be allowed to keep the bulbs plump. It thrives well in the warm part of the Cattleya house, requires an abundance of light, and a tolerable amount of sunshine. Warner and Williams' *Orchid Album*, t. 332.

NATIONAL CHRYSANTHEMUM SOCIETY.—The first provincial show of the above will be held in November next, in conjunction with the fourth annual show of the Sheffield and West Riding Chrysanthemum Society and the Sheffield and Hallamshire Gardeners' Mutual Improvement Society. We note in the schedule that the prizes are very liberal in amount, one—that for the best representative collection of cut flowers of large flowering varieties—being of the total value of £24 15s.

linear-oblong, sinuately toothed at the margin, blackish-green above, hoary beneath. The flower-heads are on axillary stalks rather longer than the leaves, the heads three quarters of an inch across, and surrounded at the base by a many-rowed involucre of oblong appressed bracts covered, like the stalks, with star-shaped hairs. The leaves exhale an aromatic fragrance.

Rhododendron cinnabarinum.—A dwarf species, with shortly stalked membranous leaves, 2 inches long by 1 inch in width, oblong, obtuse, glaucous-green, and glabrous above, beneath studded with circular scales. Flowers at the ends of the branches on short, recurved, scaly stalks; corollas exceeding 1 inch in length, tubular, funnel-shaped,

furnished, and to which it probably owes the name given to it by the New Zealand colonists—"Wild Irishman." The leaves are minute, linear-obovate, entire, glabrous; the flowers inconspicuous, whitish, like those of a *Colletia*, but without petals. It would make a good hedge-plant. The spines were used by the natives for tattooing purposes.

A FINE *SEQUOIA GIGANTEA*.

In the autumn of 1855 I planted a very small Wellingtonia. I have to-day (June 23) had it accurately measured, and the measurements may interest those who have trees of the same age. The height is 70 feet; girth of trunk (18 inches from the ground), 10 feet 6 inches; outside circumference of

branches, 80 feet; this outside circumference would have been greater, but that I have frequently removed the lower branches. *Henry N. Ellacombe, Bitton Vicarage.*

TRANSPLANTING HOLLIES.

Everyone who has had anything to do with transplanting Hollies knows what ticklish things they are to deal with unless caught at the right time, the safest season for their removal being either just before growth commences, or immediately after it is formed and has become a little firm, when plants, even of large size, may be lifted and replanted with safety. To do this and ensure success, it need hardly be said that a certain amount of care is needed, the chief things to be particular about being to secure as large a ball as possible and to well fasten it together before removing it from the hole, and to plant with no loss of time. The holes should be dug first where the plants are to go, and they should be made much larger than the mass of earth and roots to be placed in them, so that the latter may be stretched outwards and not left in a confused tangle. The subsoil should be broken up, and if bad it ought to be removed. After setting the plant in its station some soil should be worked into every crevice and hollow, and after this the plant should be thoroughly watered, a short time afterwards filling in the rest of the soil, and making it firm. A mulching of some sort should be given, unless the branches quite cover the soil and by thus keeping the soil shaded it will remain moist for a long period of time. *J. S.*

THE APIARY.

CAPACITY OF HIVES.

A GREAT variety of opinion exists as to what ought to be the capacity of a hive. Some say they ought to be very large, and others that they ought to be very small. My experience points to the use of large hives. Of course it would be very foolish to put a very small swarm into a very large hive; the proper thing to do is to put the swarm into the hive suited to its capacity, but to encourage the use of large hives by getting them a little larger each time. Our departed friend Pettigrew got his hives larger and larger, until he had some 20 inches in diameter. Beginning with smallish hives, his swarms got larger and larger, until they were fit to put into the 20-inch hives, and fill them, and in good seasons to fill a large super as well. If a swarm be put into a skep, and keep up in one corner of it, that skep is too large, and a smaller one should be chosen; but if it spread all over the roof, and downwards as well some distance, the skep is suitable. It is very easy to manage the matter in a bar-framed hive, as it can not only be made to suit the swarm at the commencement, but can be continually added to as occasion requires. A good swarm can generally be entrusted with seven frames, and will very soon fill them; but a swarm that will fill seven frames ought to be supered at the same time it is hived. This was not formerly practised, but experience has proved the advantage of it. And the reason is not far to seek. It is the instinct of bees to store honey at the top of the frames, and the brood down lower. If a swarm is hived simply on frames it will build downwards; and if supered after this, it is probable that the bees will take no notice of the super, but continue their work downwards. If, on the other hand, the swarm is supered at the same time as it is hived, the super being at the top, the bees will at once work in the supers as well as the frames, and the work will go on simultaneously both above and below. The super is, of course, the top as far as the bees are concerned, for they do not know that the top is to be lifted off when filled. Therefore we say use large hives. Little hives produce little swarms, and little swarms are often altogether useless.

LEAVING SUPERS ON DURING WINTER.

There are many who do this, and the bees do not seem to come to any harm in consequence. We do

not see why they should not be left on. It is often more trouble to take off partly filled sections than full ones, and if left on there is ample upward ventilation, which is allowed to be a very good thing. We have often heard (and find it repeated in the

will assuredly get what honey there is to be had. *Bee.*

PLANTS AND THEIR CULTURE.

APHELANDRAS.—Although many species of Aphelandras have been introduced, yet those which have a real horticultural value are but few in number. When any of these few species are well done, they are not only showy, but distinct-looking, valuable decorative subjects, their terminal spikes of flowers being freely produced from every shoot. There are several ways in which to grow the plants, some persons preferring large bush plants, obtained by cutting hard back after flowering; others confine them to a single lead, and grow a quantity of them, using 48's or 32 pots. Something may be said in favour of each form, but I think the style of growing them should be made to depend greatly on the habit of the plant: for example, one of the best autumn-flowering species, *A. cristata*, which has a rather free, long-jointed habit; looks much best when grown as a fair-sized specimen from 2 to 3 feet over, its orange-scarlet spikes of flowers being then seen clear above the mass of foliage, in which condition the plant makes a capital exhibition subject. This species is at present growing freely, and if at all pot-bound should be assisted with liquid manure, as the stronger the shoots the finer will be the spikes of flowers next season. Moreover, if the plant suffers any check, the foliage is apt to turn yellow and drop, which detracts from the beauty of the plants. In species like *A. aurantiaca* and *A. Roezlii*—the latter a dwarf grower—plants with single stems, and growing in small pots, are to be preferred, when so grown, and flowering as it does in winter, it is perhaps the most useful of the genus. Its brilliant cinnabar-coloured flowers, and silvery-frosted-like leaves, associate well with other plants. This plant is easily raised from seeds, which almost every plant is sure to produce more or less. But in order to obtain the seeds some little care is necessary to prevent them from being spontaneously scattered by the plants themselves; and as the seeds do not all ripen at one time it is a good plan immediately it is perceived that ripening has begun, to tie or rather roll a piece of moderately stiff writing-paper round the flower-spikes, merely tying it at the bottom, and allowing it to remain until the majority of the seeds have ripened, when it should be removed with the spike intact. Having secured the seeds, sow them in well drained seed-pans, using a free sandy compost, and place in a moist, growing stove temperature. As soon as the young seedlings are fit to handle, prick them off into pans or boxes, and subsequently, when large enough, pot off into well-drained 48's. All the Aphelandras like a light mellow loam, and a temperature in summer of about 65°, and 10° less will suffice in winter. They should be freely syringed during the growing season as this tends to keep them clean and healthy. *A. Leopoldi* has citron-yellow flowers and deep green leaves, which are beautifully veined with white. Similar to this is *A. fascinator*, also banded and marked with white, but the ground colour of the leaves is of a lighter green, and the under sides are claret coloured; the flowers are deep orange-scarlet. *A. chrysops* is a distinct yellow-flowered species, and is on that account worthy of being added to a collection. Whether propagated from seeds or cuttings, the present is a seasonable time to raise plants of *cristata* and *Roezlii*; the latter will yet have time to make nice flowering plants for the coming winter and spring. The plants are better when the shoots are not pinched back. Cuttings of *A. cristata* put in now would form nice flowering plants a year hence, taking care not to stop them later than September. Cuttings of the other species may be put in now, or at any other season of the year as required, as they will root readily if placed in an ordinary propagating frame, and treated in the usual way.

Richardia ethiopica.—These useful and beautiful plants are grown in various ways in different parts of the kingdom. Some growers plant them out, and often with success, but all things considered, growing them in pots and affording shelter from the weather is the safest plan to follow. Moreover, if planting out be carried on pots are still the best in the earlier stages of growth. As *Richardias* are in most request in winter and spring, the summer is obviously the most suitable time to give the stock a general overhaul. In doing this the offsets should

FIG 110.—EUCALYPTUS URNIGERA: ADULT FOLIAGE.
(SEE P. 798.)

British Bee Journal last week) that if supers are left on all the winter the bees turn out just as well in the spring, and sometimes will have them filled by the time other people are just putting them on. The early bird gets the worm, and the early beekeeper

be assorted into sizes and kept for single crowns; the largest plants, and those which are likely to produce a good crop of suckers, when being forced into flower, should be put into 24's, the next size into 32's, and smaller ones, which will be repotted later, will do with 48's, putting in the largest ones singly, and the smaller at 3 inches apart. A rich loam suits the plants. The drainage should be small in quantity but well placed, and plenty of room should be left for giving water, making the soil moderately firm. After potting, plunge the plants in cold pits or frames—if the latter, they can be conveniently filled by placing the tallest plants at the back, and the smallest at the front. When the plunging is finished, give the whole a good soaking of water. Shade, syringe, and keep rather close until new growth commences, gradually giving more air, until on fine days the sashes may be taken off. Plants so prepared will have fine, large, well-ripened crowns, which are easily forced into flower. Of other forms, albo-maculata is the only one usually met with, and this succeeds under similar treatment to athiopia. It is a weaker grower. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

HARDY PERENNIALS.—Young plants raised from seed this year, and which have hitherto been treated in a cold frame, will require to be shifted into larger pots, the most vigorous plants to be put in 4-inch pots, which will carry them on till the time arrives for planting them out. Smaller plants should be put into smaller pots, bearing in mind that no good is to be gained by over-potting. Use clean pots and ample drainage, the last point being of great importance to this class of plants. After potting the majority of these plants it will be better to stand them in the open air in sunk beds of cinderashes. In potting use a compost of three parts fibrous loam, one of leaf-mould, and one of sand; and when the roots reach the sides of the pots attend well to watering, and also to keeping the surface free from weeds and moss. Continue cold frame treatment for slow growing and delicate subjects, and also for seeds which have not germinated, such as Himalayan Primulas, Dodecatheons, or others that cannot be depended upon to come up under a year at least. Do not allow the soil to get dry, nor, on the other hand, excessively moist, and keep the pots shaded from bright sunshine, and the soil free from weeds and moss.

Violas and Pansies.—To prevent damage by wind these should now be looked over, and all strong or straggling shoots pegged down, and their position made more secure by having a little fresh soil placed round about their stems. Neglect of this not unfrequently results in the plants being twisted off at the collar—in exposed situations, at all events, they are very liable to be injured from this cause. Pansy cuttings may be put in any time between now and September, but for strong plants that will stand well the inclemency of the winter and produce high class flowers we like to get them in early. Make up a specially prepared bed in a shady place, and rake in a liberal admixture of finely sifted mould and sand on the surface.

Seeds.—No time should be lost in making a second sowing of Brompton Stocks, Sweet Williams, Antirrhinums, and other hardy biennials, in the event of undue losses, or unsatisfactory results from the first sowing, bearing in mind that the smaller the seed of any given species the nearer to the surface it must be sown.

FRUITS UNDER GLASS.

STRAWBERRIES.—The latest lots of these will now be making satisfactory progress in cold pits and frames. Give abundance of water when the plants require it, and admit all the air possible. It is quite a relief to get these spidery subjects out of the houses. Young stock for next season's supply must have attention as soon as the runners are in a fit state for layering. This should be seen to, as success depends upon having the plants as early into their fruiting pots as possible, in order to secure large plump crowns for forcing; otherwise first-class results need not be looked for. There are several methods adopted for securing runners, all of which have been attended by good results. Some recommend the runners to be layered into 5 and 6-inch diameter pots at once; this has the advan-

tage of saving a considerable amount of labour in potting and watering, but unless every care is taken in watering, the soil is in some danger of becoming sour and much of the manurial properties are in consequence destroyed or washed out of the soil before the roots lay hold of them. Others advise the ground being forked between the rows, and some sharp rich material placed in a ridge on which the plants are layered. This saves a deal of labour in watering and is to be preferred to the other method; but when the plants come to be lifted for potting the roots are certain to get damaged to a greater or less degree. I have tried both these systems, but prefer layering the plants into 60-pots. These are filled with rich compost—two parts loam, one leaf-mould, and a little old Mushroom-bed manure, the pots may be plunged in three or four rows close together between every other row of Strawberries, a good strong runner being secured for each. Pinch the points from the runners beyond the one nearest the base, and secure each in its place by a stout peg or by a stone. The stone is preferable, as it keeps

about five weeks, the time varying with locality. If the trees are well established and have filled their allotted space, the young shoots should be pruned back to the fifth or sixth bud; and should the trees be young ones, stop the shoots at about one-third of their length, or they may be left longer than this, if required, merely pinching out the top of the leaders of pyramids. Avoid pruning the shoots on those trees which have become defoliated by caterpillars, and encourage them to make as much growth as they can, so as to repair the loss of foliage as soon as possible. Any trees that are making rank growth, and which produce little or no fruit yearly, should be noted down, with the view of root-pruning them in the autumn. While proceeding with the pruning of Apple trees, keep a look-out for the webs of the caterpillars of the small ermine moth, which are present in great numbers this year. The caterpillars will be found in the interior of the webs, and if these latter are carefully and quickly removed, and cast into a bucket containing some petroleum, it will be the means of lessening their ravages another season. These caterpillars and also those of the winter moth have wrought great havoc in the orchards in this neighbourhood—so much, that in some instances, the crop of fruit is quite ruined.

Ply the hoe diligently in all fruit quarters, for after the recent heavy rains the surface of the ground will have become quite hard on many sorts of land. Apple and Pear trees bearing heavy crops of fruit should have a mulch of half decayed manure placed over their roots, as by so doing, the quality of the fruit will be greatly improved. The thinning of Apples and Pears is better deferred a little longer, more especially that of Pears, as the selecting of the fruits which are to remain on the trees, can then be done with greater advantage.

As opportunities offer proceed with tacking-in the shoots of Peaches and Nectarines, pinching-in all the laterals. Morello Cherries will also require looking over, and should black aphid be found, adopt prompt measures for destroying it. The garden-engine, or hose, should be kept at work, and all fruit trees on walls should be subjected to thorough washings morning and evening of fine days. Should American blight be found on Apple trees, brush the affected parts with a little petroleum, which will destroy the insect instantly. *A. Ward, Stoke Edith Gardens, Hereford.*

FIG. 111.—FOLIAGE OF EUCALYPTUS CORDATA: INVARIABLE. (SEE P. 798.)

THE KITCHEN GARDEN.

GENERAL DIRECTIONS.—Tomatos will now be growing freely, and should have all the lateral shoots pinched out as soon as possible, in order to strengthen the main branches. All the principal leaves should be carefully preserved, and if any of the fruits are required for show a few of the best plants should be thinned as soon as the fruit is large enough, leaving only the largest and best shaped. These plants should afterwards be supplied with liquid manure occasionally, and all should be mulched with half-rotten manure, and be well supplied with water if the weather prove hot and dry.

Any Broad Beans in flower should have their tops pinched off, which will assist the pods in swelling, and ensure a better crop. The garden should be kept clean by hoeing, and any plants of Groundsel or Shepherd's Purse should be collected, as soon as they flower, and burnt, for it is useless to hoe them up and leave them on the ground after the flowers appear.

Late Peas coming up will require protection from the ravages of sparrows. Galvanised iron-wire guards are the best protectors, if removed before the plants touch them, and threads of white cotton crossing each other about a foot above the surface will often prevent their attacking the Peas. The last sowing of Peas should now be made, and should consist principally of Sturdy, a few William I. or other approved early variety. The early ones will be ready for use, if even a early frost should destroy the later Peas.

More seeds of Scarlet Runners and French Beans should also be sown in a sheltered position for the latest crop. Succession crops of Lettuces should be transplanted as soon as the young plants are large enough to handle, and if the weather should be dry, the earlier planted beds may be mulched and watered well, or the plants will run to seed when most wanted. The latest sowing of White-Cos should now be made, and also a small one of Endive for early use. *W. H. Divers, Ketton Hall, Stamford.*

the soil in the pots from becoming so dry in hot weather. It is not such a serious matter to water when the plants are plunged as described, as a watering-pot with a flat rose can be run over a good breadth every afternoon. In about fourteen days the plants will be ready for transferring into their fruiting pots. Those intended for early work should be potted in 5-inch, and the main lot in 6-inch diameter pots, by the middle of July if possible. Let the pots be well drained, and on the top of the drainage place a good dusting of soot, as a barrier against worms; pot firm, and disturb the roots as little as possible in the operation. *W. M. Baillie, Luton Hoo.*

THE HARDY FRUIT GARDEN.

GENERAL WORK.—Apples, Pears, and Plums in bushes and pyramids will now be ready generally for their summer pruning, to be followed by another in

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Now ready, in cloth, 11s. 6d.

on the books. Twelve pensioners had only subscribed for a few years, while no fewer than forty-three pensioners never subscribed a penny to the Institution. If they could have done so at one time, and did not, we do not envy their reflections.

The average age of the existing pensioners is seventy-four, the range being from one hundred to fifty-one years. The oldest pensioner on the list was a contributor for eighteen years, and consequently subscribed as many guineas. In 1860 he was placed on the pension-list, and has since received the sum of £420. His 18 guineas must be admitted to have been a remarkably good investment. The youngest pensioner on the list is a widow, whose husband subscribed £15 15s. to the Society. At the death of the husband in 1875 she became a pensioner, and has since received a sum of £168.

By the recent Act of Parliament the dividends in the Funds property of the Institution have been reduced from £3 per cent. to £2 15s., thus entailing a direct loss to the Society of £52 10s. yearly, commencing in 1889, and unless this deficit can be made up the committee will be under the unpleasant duty of reducing the number of pensioners by either three or four. It remains therefore for all those, particularly gardeners, who have the welfare of the Society at heart, to do their utmost to assist the committee in their endeavour to promote the welfare of the

serve on either committee." Letters of thanks were read from the Royal Society, Linnean Society, and Society of Antiquaries for the contribution of flowers and foliage plants sent on the occasion of their respective annual *soirées*; and also a letter from the Society's solicitors, promising that the new by-laws, duly revised, should be put before the Council within a fortnight.

THE GARDENERS' ORPHAN FUND.—A meeting of the committee took place at the Caledonian Hotel, Adelphi, W.C., on the 22nd inst., Mr. GEORGE DEAL presiding. The Honorary Secretary announced that the sum of £40 had been contributed during the past week, and of that amount £12 10s. was sent by Mr. D. T. FISHER, local secretary for Bury St. Edmunds. Some discussion ensued on a letter of enquiry from a local secretary, with the result that the committee proposed two important additions to the rules, which it is believed will meet with general approval. The first is:—That any local secretary obtaining in small sums the amount of £5 in any one financial year, shall have a vote for every such amount so obtained; but it is not inclusive of any annual donations or annual subscription. The second is:—That in the case of donations from local associations, corporate bodies, or individuals, such donations will accumulate year by year, and when the sum of £5 is reached it shall be counted as a life-subscription, and carry a vote accordingly. Some addition to Rule 2 being considered necessary, it was resolved that the committee recommend that Rule 2 be amended at the ensuing annual general meeting as follows:—Line 3 to add, "in

FIG. 112.—SECTION OF FLOWER-GARDEN. (SEE P. 806.)

The Gardeners' Royal Benevolent Institution.

THE prosperity and public spirit of any class of the community may often be gauged by the condition and progress of its charitable institutions. Tried by such a test, horticulture is not altogether wanting, though it is to be wished that the support afforded to the benevolent societies were more general and more diffused than it is. Nevertheless, the Right Hon. JOSEPH CHAMBERLAIN, who is to take the chair at the dinner of the Gardeners' Royal Benevolent Institution on Wednesday next, will have a very nice illustration of evolution from small beginnings—of constant progress, and fitting adaptation to new circumstances.

When the Institution was founded there was a doubt among the founders (among whom we may mention the names of JOHN LEE and E. R. CUTLER as still working for the Society), as to whether the funds in hand would be adequate to fulfil the first demands on the Society. Contrast that state of things with the present, when the number of pensioners is 126, who are aided and comforted in their need by an annual expenditure of £2252. Of the 126 existing pensioners fifty-seven receive their pension as it were of right, and without having been subjected to the trouble and expense of an election. Payment of the subscription for fifteen years by the husband secures this certainty for himself or for his widow, while in any case the widow of a pensioner succeeds to a pension of £16 a year, and of these there are now fourteen

Society, which has now existed for forty-nine years.

The Right Hon. JOSEPH CHAMBERLAIN, the Chairman of the ensuing Festival, fully realising the difficulties of the committee in the reduction of one-twelfth of their annual income—viz., £52 10s.—has instructed the Secretary to put down his name for that amount, and he trusts that the friends of the Institution and gardeners and lovers of gardening will assist him to the best of their ability, so as to make the occasion of his presidency a marked feature in the annals of the Institution.

THE ROYAL HORTICULTURAL SOCIETY.—We are rejoiced to be able to announce that the Society's financial condition is now such that all outstanding liabilities are discharged or provided for, and a very considerable balance in hand remains to the credit of the Society. This happy result should be, and doubtless is, some compensation to the Council for their assiduous labours, and will encourage them to proceed in the arduous task of reconstruction. They have earned the thanks of the community.

COUNCIL MEETING.—At a Council meeting, held on June 26, a report was read from the sub-committee of the Council in regard to the arrangements for 1889, and it was decided to give publicity to the following notice:—"That the Council, having now in hand the composition of the Fruit and Floral Committees for 1889, would be glad to receive suggestions from the general body of Fellows as to any Fellows whom they may consider eligible to

private, public, and market-gardens," so that it will read—"Foremen in private, public, and market-gardens, &c." It should be stated that the committee bring forward this addition in order to widen the basis of the Institution, many persons having been led to the conclusion that the market-garden element in particular was excluded from the benefits of the Fund. Due notice of the recommendation will be given in the notice convening the meeting, in compliance with the regulation set forth in the last rule.

THE LATE DR. ENGELMANN.—The munificence of Mr. HENRY SAW has secured the publication in a collected form of the heretofore scattered papers of the late Dr. ENGELMANN, under the editorship of Professor THELHUS and the late Dr. ASA GRAY. Not only the letterpress is thus reproduced, but in many instances also the illustrations. Thus, in the volume before us, we have nearly one hundred lithographs of Cactaceae, which are most serviceable to students of these plants. Dr. ENGELMANN's papers on Conifers, Oaks, Yuccas, Agaves, Vines, and other groups, to which he devoted attention, are given in full, together with very numerous minor papers; a full index is supplied, as well as a preface and a memoir by Dr. ASA GRAY. When it is remembered that botanical work was only done by Dr. ENGELMANN in the scanty leisure afforded by professional labours, the bulk of this volume will seem no less remarkable than the conscientious thoroughness with which each paper was, so far as circumstances permitted, worked out.

FRUIT AND FLOWERS AT CHISWICK GARDENS.—Very interesting just now is a fine collection of

Ivy-leaved Pelargoniums in choice variety, double and single-flowered; and a display of German Iris outdoors. The long vinery, as it is called, gives promise of a fine crop of fruit this season, the Gros Colmar variety looking especially good. Strawberries, will be good crops. To those interested in vegetables there is a collection of some forty varieties of Cabbages to be witnessed, which are at the present time in capital trim. There will be in a few weeks a fine show of Tomatos in fruit, one house—the Rose-house being filled with Tomatos planted out; and another house is filled with plants in pots.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

—At a meeting of this Society, held on Saturday last,

PENTSTEMON MENZIESII.—A shrubby, much-branched species, with rather thick spoon-shaped, glabrous, finely-toothed leaves, about an inch long, by half an inch in breadth. The flowers are borne in racemes at the ends of the branches, and are about 1 inch long, and of a deep rosy-lilac colour. The yellow anthers are densely woolly. The plant is a native of the mountains on the north-western side of North America. Received from the Royal Botanic Garden, Edinburgh.

CLINTONIA ANDREWSIANA.—From the Edinburgh Botanic Garden we have received a specimen of this perennial Liliaceous plant, which has approximate, sessile, broadly ovate glabrous leaves, resembling, in size and form, those of the Col-

sents a sum of from £80,000 to £120,000 annually, promises to diminish in consequence of a blight which has appeared on the Chestnut trees, and which is locally known as the *piel noir*, or black-foot. The matter is being carefully investigated, in the hope of finding a remedy for this disease, which seriously affects the whole agricultural population.

TABLE DECORATIONS.—The *Queen*, not content with describing such personalities as the dresses worn at private dinner parties, now extends the system to describing the decorations of the table; in due time we shall have the *menu*. We transcribe some portion of the article:—"On Saturday, the 16th inst., Mrs. P. W. gave a very pretty entertainment, when the table was decorated with shaded

FIG. 113.—PLAN OF GARDEN. (SEE P. 806.)

the Duke of TECK, the President, presented a Gold Medal and purse of fifty guineas to Mr. ELLIS, L.R.C.P., of Liverpool, the winner of the Queen's Jubilee Prize given by the Society for the best essay upon the "Plants and Vegetable Products introduced into the United Kingdom for Use in the Arts and Manufactures, and for Food, during Her MAJESTY'S Reign"—a criticism of which will be found on another page.

NICE FOR THE JURY.—Among the prizes offered at the International Horticultural Exhibition to be held at Cologne is one for the best Tobacco for chewing. The schedule does not inform us who are to serve on the jury—perhaps a party of Jack Tars would be a sympathetic and appreciative tribunal.

chicum. The flowers are borne in umbels at the end of long, erect, naked scapes about 2 feet in height. The pedicels are ascending, spreading or reflected, very slender, about half an inch in length, rather shorter than the elongated, bell-shaped flowers, which consist of six oblong segments of a deep rose colour. The flowers are followed by blue berries. The plant is a native of California, and is amply worth a place in every herbaceous border, though it is rarely seen. Some of the allied species have been described as species of *Smilacina*. The Lobeliaceous plant, also called *Clintonia*, should now be called *Downingia*, the plant now alluded to having the prior right to the name *Clintonia*.

CHESTNUT DISEASE IN BREST.—It is reported from Brest that the Chestnut harvest, which repre-

pink Roses, placed in stands, and laid on the cloth. The same evening Mrs. M. had her dinner-table decorated with foliage Ferns and other rare kinds of leaves. Mrs. W. chose choice Pinks, Roses, and mauve Orchids for her table—a most lovely and rare combination. On Monday Mrs. T., in Pembroke Square, had white flowers and ornamental foliage disposed about the cloth; and Mrs. R. had nothing but pink Roses. On Tuesday Lady B.'s table at Chesterfield House was decorated with long wreaths of rare ornamental foliage and Mignonette, arranged in many new designs; and here, again, the scent was most delicate and delightful. Mrs. C., in Portland Place, had a table superbly decorated with choice and varied foliage, corsage bouquets being prepared for each lady, and button-holes for the gentlemen. Mrs. M. had rare mauve Orchids on her

table, intermixed with pink Orchids, arranged in a central stand, from which radiated long wreaths on to the cloth. Lady T., in Grosvenor Place, had a table decorated with alpine Poppies and grasses, arranged in stands and on the cloth, with much artistic skill; and Mrs. P. selected the same mixture. Mrs. P. had a lovely display of pink Roses and Mignonette, arranged in new designs upon the cloth. Lady O'N., in Lennox Gardens, gave a large dinner party on Tuesday, the guests expressing much admiration for the arrangement of alpine Poppies and wild flowers, some of which were arranged in silver wheelbarrows. The Hon. Mrs. C. had also selected wild flowers, grasses, and alpine Poppies. Mrs. H., in Hyde Park Square, had a table decorated with white flowers and ornamental foliage."

TALISIA PRINCEPS.—Much interest attaches to this plant from its mode of growth, and the circumstance that for years it has been supposed to be either a *Theophrasta* (*T. pinnata* JACQUIN), or a *Brownea* (*B. princeps* and *B. erecta*), LINDEN, *Catalogue*. Now that it has flowered, at Kew, Professor OLIVER recognises it as a species of *Talisia*, a genus of Sapindaceæ. The stem produces no lateral branches, but each year forms, at its extremity, a superb plume of spreading, broad pinnate, acuminate leaves, at first flushed with rose, and attaining a length of 6 feet. In addition to these fully developed leaves, or rather preceding them in order of development, is a series of much smaller, erect leaves, also pinnate. Thus the plant produces leaves of two distinct forms, while its mode of growth is like that of a *Cycas*. The flowers are small, very numerous, and borne in large branching panicles. It is supposed to be a native of Venezuela, but at present is only known from cultivated specimens. It is figured in HOOKER'S *Icones*, t. 1769.

ST. NEOTS HORTICULTURAL SOCIETY.—The annual exhibition of this Society will take place, as usual, on Bank Holiday, August 6, and among the prizes offered is that of a Silver Cup, value £5, for twenty-four blooms of Roses, dissimilar, the Cup being offered by the President, A. J. THORNHILL, Esq., Diddington. The balance-sheet shows a surplus of £30.

ORCHID PRICES.—At the sale of the first portion of the collection of Orchids formed by F. A. PHILNICK, Esq., Q.C., which took place at the Central Auction Rooms, Cheapside, on the 26th and 27th inst., under Messrs. PROBERT & MONNIS, the following were among the best prices realised:—*Lælia anceps* Dawsoni, £31 10s.; *L. elegans* Turneri, £27 6s.; *L. lilacina* ×, £21. Twenty-three guineas were paid for *Cattleya Triana* Clio; and 22 guineas were realised by C. Mendelii Wallacei, and also by *Cypripedium Veitchii*; *Coleogyne cristata* Lemoniana, reached £21, and *C. c. alba*, 18 guineas.

CINCHONA CULTURE IN JAVA.—The low price at which quinine has ruled for some time past in the European markets is making itself felt in the Cinchona plantations. Advices from Java state that "prices in the home markets are anything but encouraging, and this will no doubt act as a check to the expansion of the area under cultivation." Up to the end of last year, however, the exports were steadily increasing, as year by year the more recent plantations attain the requisite age for harvesting the bark. During the past year the shipments amounted to about 1400 tons against 1100 tons in 1886, the Government plantations contributing in each case about a quarter of the whole quantity.

TRADE NOTICE.

MESSRS. SUTTON & SONS, seed merchants, of Reading, and 5, Westminster Chambers, S.W., announce the retirement, by effluxion of time, on May 31 last, of Messrs. Martin Hope Sutton and Alfred Sutton, who have been members of the firm for more than fifty years. The firm of Sutton & Sons will be continued in future under the same style and title by the sole proprietors, Messrs. Martin John Sutton, Herbert Sutton, Arthur Warwick Sutton, and Leonard Goodhart Sutton, who have for several years past been the acting partners.

PLANT PORTRAITS.

ANGREECUM SEDENI, Rehb. f., *Lindenia*, t. 135.—Segments white, linear lanceolate, spur orange-coloured. See *Gardeners' Chronicle*, 1878, p. 133.

ANTIRRHINUM NUTTALLIANUM, Bentham, *Gartenflora*, t. 1275 (3), June 15, 1888.—Small species, with ovate leaves and small flowers of a bluish colour, with an orange palate, like *Linaria cymbalaria*. South California. Dammann & Co., Portici, Naples.

BAHIA CONFERTIFLORA, DC., *Gartenflora*, June 15, t. 1275 (1).—A dwarf perennial Composite, with finely cut hoary foliage and yellow flower-heads. Native of California, introduced by Dammann & Co., Portici.

CATTELEYA INTERMEDIA VAR. GIUZZIE, *Lindenia*, t. 133.—Flower-segments white, linear lanceolate, lip white, flushed and striped with rose.

CHLENACTIS TENUIFOLIA, Nuttall, *Gartenflora*, June 15, t. 1275 (2).—Dwarf, cut-leaved, yellow-flowered Composite, from Southern California, suitable for borders. Dammann & Co., Portici.

ERIA STRIOLATA, *Illustration Horticole*, t. 48, May, 1888.

EUPHORBIA APHYLLA, *Gartenflora*, p. 277, May 15, 1888.

EUPHORBIA JACQUINLEFLORA, *Garden*, May 26, 1888.

ODONTOGLOSSUM TRIUMPHANS, Rehb. f., *Lindenia*, t. 134.

OXERA PULCHELLA, *Garden*, June 2.—See *Gardeners' Chronicle*, February 18, 1888.

STANHOPEA PLATYGERAS, *Garden*, June 9.

VANDA SUPERBA, hort.—A form of *V. lamellata*, with spreading flower-segments of a primrose-yellow colour mottled with red, the two lower sepals especially; lip relatively small-lilac. *Lindenia*, t. 135.

WARREA TRICOLOR VAR. STAPELOIDES, Rehb. f., *L'Orchidophile*, June, 1888.—Flower-segments pale primrose, petals with reddish stripes, lip broad, scoop-shaped, obtuse, reddish-brown. Vervæet & Co., Mont St. Amand, Gand.

ZYGOPETALUM MANILLARE, *Illustrierte Monatshefte*, June, 1888.

LANDSCAPE GARDENING.

BEFORE explaining the different features of the plan (fig. 113, p. 805), I will first make a few remarks from observations I have made at various times in different parts of the country. It appears that before laying out a private park the extent of the estate is not always sufficiently considered so as to make the former in proportion to the importance and style of the house, which often leads to the grounds being made beyond the limits of prudence and economy in the matter of occupation and keeping. Extent and beauty are quite distinct objects, and I think, a small garden where the boundary is not obtrusive is often more elegant and interesting, as well as being more convenient, than a large park.

The pleasure-grounds and park shown in the plan, fall more or less gradually in parts down to the stream, which runs through the estate, and part of which I have converted into an ornamental lake, with a small wooded island in the centre, also rock-work, covered with Ferns and mosses, and rustic bridges spanning the stream—all of which confer an additional beauty to the whole place. The proprietor may also derive a real advantage from its utility by being able to have a boat, for which a boat-house is provided, and also by keeping it well stocked with those kinds of fish which thrive well in clear fresh water. The path which leads round to the further side of the lake in the park being defended from the inroads of stock by an iron fence.

The house, with conservatory attached, is on a broad terrace, with an elegant vase at each corner. The views of the grounds and lake from the principal apartments are very fine, with a church and another large gentleman's residence in the distance. A rustic summer-house is placed on the lawn, which is kept well rolled for tennis, &c.

The large flower garden with fountain in the centre is designed so that the beds are formed on

slightly sloping ground (see section, fig. 112), which shows the flowers off to good advantage. There are beds for ordinary bedding plants, the large outside beds being meant for hybrid perpetual Roses, and the smaller ones for Teas. There are covered garden seats, so placed as to command different views of the grounds.

The back road, which leads to other parts of the estate, is very convenient for tradesmen going to the house, as well as for the stables, and kitchen garden. A range of greenhouses and vineries is provided; there are frames; potting and boiler-shed, with soil heaps, &c., on other side of walk. The gardener's lodge is convenient of access to the greenhouses and garden. *A. G. Jackman, Woking.*

HOME CORRESPONDENCE.

OUTDOOR GRAPES.—Mr. Froude, in his *Oceana*, says, when speaking of New Zealand:—"Outdoor Grapes may be had for the asking, and are good enough for all ordinary appetites. There are also Grapes grown under glass for those who can only be satisfied with expensive luxuries, &c." I have long entertained an idea that some varieties of Grapes, with proper attention, might be better grown in the open air in this country than is generally found to be the case, and it would doubtless be interesting to many to ascertain the names of the varieties which, according to Mr. Froude's account, are found to succeed so well in the open air in the vicinity of Auckland, or, if such varieties have already been introduced to this country. If so some of your readers may be inclined to furnish the desired information. At present, so far as I know, there are but few varieties which, with every attention, such as training, stopping, and the careful thinning out of the fruit, are found to ripen well out-of-doors in this country. And the quality of these varieties, even when grown under glass with every necessary attention, is only moderate: hence the desirability of in some way securing other, and, if possible, improved varieties for open-air culture. Could the hybridiser or rather the cross-breeder be induced to give this matter serious attention, it is possible that the result might be of even more value than attempts to introduce supposed suitable varieties from the continent of Europe or the colonies. Improved varieties of the Grape Vine have been obtained by the perseverance of the cross-breeder, but I am unable to say whether any effort has been made with the view of obtaining varieties expressly suited for outdoor culture. A hardy constitution and early ripening are the essentials. The Grape Vine in the open air in this country seeds freely. In the early part of last summer I noticed on the border in front of a south wall, on which a Muscadine Vine was trained, abundance of healthy self-sown seedling Vines; but what is required is a good flavour and size. The varieties which may be likely to transmit to the ordinary out-of-doors varieties improvement in the needful direction might possibly be Frontignans, Black Hamburghs, Foster's Seedling, and Ferdioand de Lesseps. *P. G.*

WYCH ELMS.—Seeing a reference to Wych Oak—the "Wych," pardon the pun, is incorrect—I am tempted to ask whether the marvellous blooming and fruiting of the Wych Elm, as seen here, has been common this season? Some fine twenty years old trees, very vigorous and spreading, have been so laden with seed-pods or vessels as to have the whole of the branches literally covered, far beyond anything of a similar kind I have ever seen. The seed-vessels littered the ground as they fell, giving the appearance of a dressing of spent Hops. Perhaps the kind is not the true Wych Elm, although so regarded here. It has broad leaves and very spreading growth. *A. D.* [We believe the occurrence is general this year. *Ed.*]

BURNT EARTH.—I can recommend this for general use. The first illustration of its value which came in my way was when engaged in carrying out a new garden a short time ago. I was greatly surprised upon entering the glass-houses to see the luxuriance and beauty of the young stock of plants, especially of Gloxinias, Ferns, Palms, foliage plants, and

Cucumbers, and on inquiry I was told that, owing to dearth of silver-sand and leaf-mould, burnt earth had been added liberally to the soils. The most delicate-rooted plants luxuriated in what was little else than crude top-spit loam with a liberal admixture of the burnt earth. It may be well to add that only the very finest siftings had been used. It would seem, therefore, that owners of old town gardens, in which the soil has lost its ordinary mechanical properties, may benefit themselves by partially burning and remixing the soil. *William Earley, Ilford.* [The value of this material in promoting root-development was shown experimentally by the Editor some years ago. Eo.]

CHAINING-UP CEDARS OF LEBANON.—Mr. Waterman writes me to-day regarding the above query, which he asked in the *Gardeners' Chronicle* of May 26, but to which he has received no reply. In answer I would say, let the Cedar branches have their own way, and mar them not by either props or chains. What Mr. Waterman says is only too true—that the branches frequently snap across just outside the band or support, and therefore the best way is to leave the branches alone, and during a calm snow-storm ease them of their burden as well as can be done by means of a long and light pole with a hook attached to the end. Props and chains, apart from the evil they do otherwise, render trees unsightly and unnatural. Do the work as carefully and tastefully as you can, chaining large limbs together that have an upright inclination is work well done, but with horizontally-inclined branches, the best way, I have found, is to leave them alone. Mr. Waterman also enquires about some of the largest Lebanon Cedars in this country—where they are growing, and size. To this I will reply later on. *A. D. Webster.* [A Y-shaped piece of wood or iron fixed on the end of the pole is better than a hook, as with this implement the branch can be raised, not pulled further down as is done with a hook—very often to the injury of the tree: some snow is shaken off when the branch is raised, and all of it is loosened, so that when the branch is allowed to fall into place the rest slides off. The iron fork should always be wrapped round with soft rag. A very large Cedar, covering many square rods of ground, and supported by many wooden posts, is, or was, in existence till recently at Addington Palace, Kent. Ed.]

YUCCA ALOIFOLIA VARIEGATA.—A well-grown example of this ornamental subject, 9 feet high, and in capital condition, is planted out in the centre bed in the conservatory at Watermouth Castle, the beautiful seat of Major C. H. Bassett, three miles south-east of Ilfracombe. The plant is very telling when contrasted with the other well-grown foliage and flowering plants in the same house. *H. W. W.*

REPOTTING LILIUMS IN MAY.—I do not propose to interpose between your correspondents, Messrs. Ward and Jenkins, on this subject beyond a line or two. There are two classes of Liliun bulbs offered for sale, home-grown and imported. The treatment of both is essentially different. The former you can shake out and repot, as indicated by Mr. E. Jenkins, when the stems die down in early or late autumn. The latter, it is still an undecided point whether to pot at all, when they arrive in November or December, or place in cocoanut-fibre until roots push out in spring. Suppose that Mr. Ward pots up his imported bulbs, or not imported, in small pots, and repots them in May into larger ones, he would be doing what I and thousands of amateurs are doing about that time with the best results. Mr. Jenkins is, to my mind, perfectly right in objecting to the "shaking out of the roots" at that time; this should be done at the first potting, and repotting without disturbing a single root-fibre whenever it is necessary to do so. No other plants, except Hyacinths, have such fragile roots. *W. J. Murphy, Clonmel.*

CONFERENCE OF FRUIT GROWERS.—I have been invited by circular to assist at a conference of fruit growers, which it is proposed to hold at the Crystal Palace, in conjunction with the annual fruit show on September 28 next. No one can find fault with the directors of that popular place of resort if they thus strive to render the Palace practically instructive as well as entertaining. What seems odd, however, is that, with a Royal Horticultural Society professedly anxious to obtain some reputation as a practical body, it should have so far utterly ignored the great question of the national production of hardy fruits, and left the field open to a non-horti-

cultural body. I have no doubt the Palace people will work the proposed Conference well, and thus perform great public service. *Pomona.* [We regret the Society has not taken this matter up this year, and continued the success it achieved at the Apple and Pear Conferences. Ed.]

FRUIT PROSPECTS.—Virtually we have no fruit in East Anglia. Apples, *nil*—all maggots; Pears, do.; Plums, do.; Apricots, do.; Peaches, fair; Raspberries, Gooseberries, and Currants, fair; Strawberries, half a good bloom, and half of those blind—a horrid record. Our diamond and ground cordons and pyramidal Apple trees look as if they had stood in the line of fire of a powerful battery. I question if I could find a perfect Apple leaf in the place!!! *D. T. Fish.*

YELLOW CORNFLOWERS.—Since the common field *Chrysanthemum segetum* has been introduced into gardens, the process of selection of the finest flowers has resulted in a remarkable development of size and beauty, so that they are now in great request. Very probably the taste for yellow *Chrysanthemums*, blue *Centauras*, and scarlet *Poppies*—three of the very brightest coloured of our wild flowers—will never die out, and any one of them mixed with grasses or cornstalks still finds admirers, especially when applied to the decoration of head-coverings. In the yellow *Chrysanthemum*, one excellent result of selection has been to lengthen the petals without increasing the dimensions of the disc, so that we have a truer flower, if possible, as the charm of nearly all flowers is found in fully developed petals. Blooms now constantly open some 3 inches across, with broad petals, some showing a little lacination, which may well lead to the hope that deeply serrate petals will be produced presently. Seeds of these flowers drop and come up in great abundance, if so permitted, but that is hardly gardening. Some half-dozen flowers, selected and marked, ripen plenty of seed, and this, if sown early in April, produces plants to dibble out, giving ample room, for in soil of moderate quality they will grow large, and yield an abundance of flowers. *A. D.*

BLIND NARCISSUS POETICUS.—It is not to be wondered at that the general blindness of the buds of the double *Narcissus poeticus* this year has attracted attention. It is many years since there has been so extensive a failure. When I lived at Eton, near Windsor, the failure of a portion of the buds was common in my garden there; but here, in West Cheshire, where the soil is heavy and retentive, though the bulbs are very abundant, it is unusual to see a blind bud; but this year at least one-third of the buds have become blind. About tea days before they ought to expand the nascent petals, when about a quarter of an inch long, and forming a visible rosette within the base of the spathe, turn brown and wet, as if scalded, and perish. The time at which they went off this year was within two or three days of May 20. I am convinced that cold has nothing to do with it, even as a predisposing cause. I have made many observations about this. For instance, the severest spring cold in recent years was in 1885, when on three successive nights late in March the average minimum here was 17°, but no failure in the flowering of *N. poeticus* took place in that year. My garden at Eton was sheltered and warm, but in a certain place where the roots of an Elm tree drew the soil, the buds nearly always went blind, but more in dry springs than when the weather was wet. I have no doubt that a predisposing cause is weakness of growth, caused by drought and impoverished soil, but the immediate cause is something atmospheric. If the blind buds are examined it will be found that the spathe is air-tight, and will explode with a crack if snapped between the finger and thumb. For some reason or other the inclosed air or gas seems to become poisonous to the weakly young petals. A month ago I noticed in this garden, where several thousand double *N. poeticus* flower every year, two small clumps, within 14 inches of one another, and at the same distance from the edge of a flower border; evidently both of the clumps were the increase of one bulb accidentally left in the soil, and the conditions of growth seemed exactly similar. Each clump had about half-a-dozen buds; on one they were all blind, on the other all flowering. I will call them B. and F. I marked them at the time, intending to investigate the underground conditions, which I did to-day. Each clump consisted of about six cohering healthy bulbs, those in F. having a stronger look. From the surface of the ground to the base of the bulbs of F. the depth was

6 inches, and the roots were fast in a lump of the natural brick-clay of the garden which hung to them. The bulbs of B. were deeper, 8 inches to the base; and the soil round the roots was dusty and light, the clay having been dug out there. This seemed to show that lightness and dryness of soil is sometimes the cause. As regards the immediate cause, I accidentally, a few days ago, came upon some remarks in Sweet's *English Flower Garden*, series ii., t. 188, and as these agree with my views and experience I will conclude by transcribing them:—"The partially developed flower seems as if it had been scalded by the heat of the sun's rays. Now as this defect occurs much less frequently in moist than in dry seasons, it is probably occasioned by the sun's overheating the air in the spathe, and exhausting the sap of the plants quicker than the roots in dry seasons can supply it, and thus as it were scalding the nascent blossoms, before they have time to accomplish their full development, and escape from the unhealthy air of the swollen and indurated spathe. Wherefore, it should seem that poverty, and consequent want of vigour is the pre-disposing, and at length efficient cause of this disease." It may be worth remarking that the sun-heat for a few days about the time that the destruction of the buds took place this year was abnormally high, my thermometer having marked 78° in the shade on May 19—an unusual heat in any time of summer on this cold soil. *C. Wolley Dod, Edge Hall, Malpas.*

The double-flowered *N. poeticus* used to go blind here, but since we took to lifting a third of the stock every year, every bulb bears a flower. If your correspondents who fail with it would go and do likewise, adding sand or gravel to the soil if stiff and cold, but no manure, I think we should hear less of "blind" flowers. All our *Narcissus* bulbs are planted 6–9 inches deep, so as to be below the drought line in summer, and the frost line in winter. We find it makes all the difference in the world to many bulbs whether they are below this line or not, and 9 inches is our limit in Dublin, although other soils and latitudes would vary in this way. Lovely warm weather here, with showers. *F. W. Burbidge.*

THE DUKE OF BUCCLEUCH GRAPE AS AN EARLY FRUITER.—I have one house—this is the earliest, planted—with three kinds of Grapes, viz., the Duke of Buccleuch, Black Hamburg, and Foster's Seedling. These three varieties of Grapes are treated alike as regards heat and ventilation, and the only difference in treatment is, that I give the Duke much more of lime and wood-ashes at the roots before starting; and also in pruning I leave as much young wood as I can, as this variety fruits best and produces the best bunch from young wood, only the wood must be thoroughly ripened. I leave on every alternate spur four or five eyes. Grapes were cut from the Duke of Buccleuch on May 26, and were fine in bunch, berry, and the colour and flavour also good. The Black Hamburg ripened twelve days later, and Foster's Seedling about ten days later than the Hamburg. Foster's Seedling is of good quality and a most abundant bearer—the best of all Vines for pot culture, which I have grown, and is, I think, the most useful of white Grapes for early work. *W. Smythe, Basing Park, Alton, Hants.*

HEUCHERA SANGUINEA.—One of the leading features among the fine bunches of hardy perennials exhibited at the recent exhibition of the Royal Oxfordshire Horticultural Society was a mass of this very fine and striking perennial. It imparted to the stand in which it was seen a rich glow of colour of a striking character. It is said to be comparatively easy to cultivate, and at the same time it is very free. *R. D.*

CONIFERS FRUITING.—I quite agree with the remarks in your issue for June 9, that the season last year being so hot and dry, induced the early ripening of the wood and the formation, if I may use the expression, of fruit-buds. Never before have I seen such a promising lot of seed on many of the trees—even the Golden Cypress in a nursery quarter which I saw the other day, will produce its seed by the bushel. I had occasion to transplant a tree of *Pinus monticola* in 1886, and when, at the end of August last year, I had to provide at a moment's notice a memorial tree for the King of the Belgians to plant, this was the one chosen as being more likely to live, having been so recently transplanted, and therefore well furnished with roots; and notwithstanding the dryness of the season it grew well, and,

singular to relate, that although only 7 feet high it is now producing a crop of cones. Now what I want to remark is, that it was the double transplanting which produced the early coning, for had this tree been left untouched it would probably not have fruited in less than a quarter of a century; and this leads me to say, Would it not be better to have recourse to this plan, when one is desirous of propagating a species or variety by seed, rather than by layering or grafting the side branches which oftentimes have a tendency to form forked leaders? The fruit trees, the nurseryman knows well, are induced by root-pruning to early fruitfulness, but I do not remember this being recommended for Conifers; I would be understood not to advocate this plan generally, but only when there is a scarcity of seed of some kind which it is desired to multiply as quickly as possible. I was much struck with the beauty of the blossom of *Abies Aleoquiniana*, which has flowered very freely here in the pinetum this season. It is just twenty-seven years since I helped the late James Veitch, of Chelsea, one winter's evening, to pick out the seeds from the cones which had just arrived from his son, the late Mr. John Veitch, who had gathered them some two months previously on the sacred mountain of Fusi-yama, in Japan, so that its blooming here for the first time had a special interest for me. *J. Rust, Eridge Castle.*

VERONICA FORMOSA.—Under this name there is in flower at Chiswick, an evergreen Veronica with pale blue flowers, in the form of small spikes. It is quite a little gem, as tiny plants blossom. I should imagine it is a species requiring greenhouse treatment in winter. As to its specific name, a greenhouse herbaceous Veronica bearing the name of formosa was introduced from Van Diemen's Land in 1825, but this is said to bear white flowers. Can any light be thrown upon the apparent confusion? *H. D.*

THE APPEARANCE OF VEGETATION.—I think it would be very interesting, and perhaps useful, if we could have a record of the effects of the exceptional summer of 1887 on the vegetation of 1888. Of course it is difficult to say exactly how far the present appearance of things is owing to the roasting of last summer, and we may confuse *propter hoc* with *post hoc*. Still if the same effects are noticed everywhere we may fairly assume the same causes. From my own observation here I should attribute to the summer of 1887 the following effects:—1. The excellent way in which many tender plants have stood the late bad winter and spring. 2. The fact that many plants, especially flowering shrubs, are flowering here for the first time. 3. The great abundance of flowers, especially on shrubs; and 4. The brilliancy of all variegations. I particularly notice this in golden variegations, which usually may be pale yellow, and mixed more or less with green, but this year are uniformly brightly golden. *Henry N. Elbowcomb, Bitton Vicarage, Gloucestershire.* [We trust our correspondents will favour us with their observations on this point. *Ed.*]

THE OLD GLOBE FUCHSIA.—Visitors entering the charming village of Lee (three miles west of Ilfracombe, and from that direction), cannot fail being struck with the beauty of a garden hedge overhanging the road consisting of this once familiar garden Fuchsia, and at the end of which there is a huge bush of it about 9 feet high and as much through in the best possible condition. I may say, in passing, that the scenery in the Lee valley, with its lofty hills, numerous steep narrow lanes, the banks and walls of which are clad with a variety of Fern, &c., is not surpassed by any in North Devon. *H. W. Ward, June 20.*

FRUIT REGISTER.

PEACH WATERLOO.

WITH this post I send you a Peach of the Waterloo, and also one of Grosse Mignonne, both of which were taken from trees growing side by side, as a proof of the earliness of the Waterloo. The tree of the former variety is carrying a crop of from ten to twelve dozen of fruit, and was planted in 1884. It has for the last three seasons cropped well, made plenty of capital fruiting wood, and I find it one of the best to set, always needing severe thinning. These trees were started in the first week of February, and forced very gently all along, with the

result that I was able to gather the first ripe fruit on June 3. I have gathered ripe fruit of it in the last week of May, and I consider the Waterloo to be six weeks earlier than either Royal George or Grosse Mignonne, and judging from the time Hale's Early ripens in the early house, it is fully three weeks before that variety. As regards flavour it is not equal to Royal George, Grosse Mignonne, or Noblesse, nor is it so large as Sea Eagle; but for earliness it is the best of all. I shall be pleased to hear if this variety has been started in December, and with what result. The leaves enclosed are from the same tree. The fruit this season is not so large as I have had them, the heaviest as yet taken from the tree barely weighing 6 oz., while the largest of last year weighed 8 oz. *H. Markham.* [The fruit was nicely coloured, quite ripe, and of fair flavour—the fruit of Grosse Mignonne wanted quite six weeks more time to ripen it. *Ed.*]

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, JUNE 26.—A bright assemblage of flowering plants, augmented by numerous cut flowers from the nurserymen, rewarded the visitor at the Drill Hall on the above date. Orchids this time paled before the gorgeous Paeonies, Pyrethrums, and Delphiniums, and out-of-door blooms generally. Some fine hardy shrubs, valuable either for their foliage or flowers, came from Coombe Wood; tuberous Begonias were plentiful, and Pelargoniums were not a few. The company which congregated in the afternoon was more numerous than has been witnessed there on most of the previous meeting days. As in winter and spring there was a want of warmth, there is now too much, and it is rendered uncomfortable by the absence of ventilation.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. Rev. W. Wilks, Dr. M. T. Masters, W. Goldring, H. Herbst, W. Bates, G. Paul, W. Holmes, R. Dean, T. Baines, C. Noble, J. Doiny, H. M. Pollett, J. O'Brien, E. Hill, B. Wynne, A. F. Lundy, G. Duffield, and J. Walker.

Hardy Plants.—The group of outdoor shrubs from the nursery of Messrs. J. Veitch & Sons was of considerable interest, including, as it did, several plants which, if not new, are yet not generally found in gardens, viz., *Escallonia exoniensis*, a white-flowered species; *Escallonia macrantha sanguinea*, *Robinia hispida*, well flowered, pink racemes; *Rhaphiolepis ovata*, *Senecio elaeagnifolius*, a bold leaved distinct looking New Zealand shrub of close compact habit; *Daphniphyllum glaucescens*, often previously noted in these pages; *Cuscalpina japonica*, a plant with pinnate foliage and spike of yellow flowers having crimson anthers and yellowish-green calyx; *Paeonia Artimise*, a double flower, rose-coloured, with white tips to the petals; *Rhus glabra laciniata*, beautiful foliage, with red ribs and leafstalk; *Eulalia japonica gracillima*, a tall greyish-green grass of graceful habit of growth; *Junciperus virginiana alba spica*, an almost white form at this season; *Philesia buxifolia*, a dwarf Yew-like bush, with crimson tubular flowers; *Veronica Girdwoodiana*, an erect growing species with small foliage and terminal spikes of blue flowers. A few Japan Maples and a few other plants of lesser interest completed the group.

G. F. Wilson, Esq., Heath Back, Oakwood, showed an Anemone species allied to *A. polyantha*; the habit is tall (2 feet), and flowers white; *Campanula* G. F. Wilson is not unlike a small edition of *C. carpatica*; the other exhibits were cut blossoms of *Milla laxa*, and *Cereus Alice Wilson*, raised and named by the late Mr. Harvey, of Boston, Mass.

One side of a long table was taken up by Messrs. Kelway & Sons' (Langport) display of Paeonies, Pyrethrums, and Delphiniums. Many of the former are recent seedlings, and consisted of both single, half-double, and double flowers, in many colours. We name only a few—the plants which were thought worthy of a Certificate, viz., *Cyclops*, purplish-crimson, double; *Mrs. Salway*, also double, a creamy-white flower; *Lady Carrington*, semi-double, pale flesh; *Maria Kelway*, of the same colour with white; *Agnes Mary Kelway*, a flower with immense guard-petals over which are inserted a dense row of thread-like petals, the middle of the flower being filled with broad petals—the colour is light rose. In Delphiniums may be mentioned *Bassanio*, a good spike

of cobalt-blue, with white mark in the centre; and *Figaro*, a bright blue, with violet-purple centre petals. In Pyrethrums of a hardy perennial character may be named *Sirius*, with numerous overlapping golden rays and brown disc; and *Buffalo Bill*, a flower with a single line of fluted florets like the annual variety, *Lorenziana*, but of a much larger size.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, contributed a large collection of hardy cut flowers, embracing, of *Liliums*, *L. maritimum*, *L. Murtagon*, *L. pardinum* var. *pumila*, and others; many brightly coloured forms of the Iceland Poppy, *Paeonies*, *Pyrethrums*, *Triteleia laxa*, *Chrysanthemum maximum*, and a semi-double *Chrysanthemum* with narrow white rays and a prominent yellow disc, *Of Calochortus* there were several good forms—one named *C. venustus* var. *citrius*, of a bright yellow ground colour, bearing spots of brown at the base of the segments, was certificated. The diameter of the flower was about 2½ inches. (Silver Banksian Medal.)

The tastefully displayed group of well-grown Irises (chiefly forms of the Spanish Iris), and a few Paeonies, from Mr. Walker, Whitton, Middlesex, attracted much attention. The following forms of the Spanish Iris were specially fine:—*Bilderdyk*, bright blue, with the usual yellow tongue on the falls; *Vondel*, rich yellow; *Canary Bird*, pale yellow; and *Almanus*, pale lilac, with falls of white. A Silver-gilt Banksian Medal was awarded.

Messrs. W. Paul & Son, Cheshunt, sent a few alpine and rock plants in pots. *Thymus serpyllum album* and a dark-coloured variety, shown as *coccineum*, were both very attractively shown in large masses; *Phyteuma comosum* in bud, a difficult subject; *Liparia latifolia*, *Mimulus radicans*, *Campanula Portenschlagiana*, and *Epilobium obovatum* were among the most noteworthy plants. The same firm also showed six boxes of cut Paeonies—*Jeanne d'Arc*, pale yellow, double, with pink guard; *Madame Lebon*, pale rose, double; *Pottsi*, a semi-double form, of the same colour as *Madame Lebon*; and *Grandiflora nivea*, very full double, pure white, but with occasionally a narrow margin of crimson to a few of the inner petals—were all good flowers.

Aristolochia ornithocephala, with its conspicuous and large flowers; and *A. trilobata*, with smaller and diller flowers, were sent by Mr. F. Ross, Pendell Court Gardens, Bletchingley.

A bright display was made by the "Shirley" Poppies, selected forms of the field Poppy, *Papaver Rhoeas*, from the Rev. W. Wilks, Shirley Vicarage, Croydon. The colour of these flowers ranged from pure white to bright red, with numerous intermediate combinations.

Orchids.—The flowering plants from the gardens of Sir Trevor Lawrence, Bart., M.P. (gr. Mr. Bickerstaff), consisted of the following:—*Dendrobium Bensonianum*, a nice piece, fall of flower; *Masdevallia Harryana*, Ball's blood, *Cattleya Mossiae Kleineckiana*, a plant with five blooms, which are white, lip also white, blotched with purple, and the throat yellow; *Thunia nivalis*, *Epidendrum atropurpureum*, sent as *E. Randii*, the sepals and petals of a greenish-bronzy colour; the lip is white, with a purple blotch and stripes at the base; several *Cattleyas Mendelii* and *Mossiae* of some merit completed the exhibit.

The group shown by Messrs. H. Low & Co., Clapton, contained many *Cattleyas*, some of fine markings and size, as *C. Mossiae aurea striata*, pale purple sepals and petals, lip beautifully filled, and of an intense shade of purple. Another variety had a purple mottled lip, with a white margin a quarter of an inch wide. *C. gigas*, *Mendelii* variety, lip and throat all of dark purple; the lip is distinctly lobed and boldly frilled. Other plants in this group were *Vanda teres*, *V. Roxburghi*, and many *Cypripediums bellatulum*, &c.

In the group sent by F. G. Tautz, Esq., Studley House Hammersmith (gr. Mr. Cowley), were *Epidendrum atropurpureum*, *Cattleya Aelandiae*, *Saccolabium Rheedii*, *Physisiphon Loddigesii*, a curiosity in Orchids, of dwarf growth, with two minute flower-spikes covered with very small orange flowers.

Miscellaneous.—The Rev. H. H. D'Ombrian showed a single flowered wild Rose with the perfume of the Sweet Brier. The parentage is unknown to the exhibitor; but it is probably a seedling from some native species. Warm-house *Rhododendrons* raised from the Sumatran species and hybrids—*multicaulis Curtisii* and *Teysmannii*—were exhibited by Messrs. J. Veitch & Sons; *Hippolyta* is orange-red; *Portia primrose-yellow*; *Taylori*, pink; *Queen of Yellows*, yellow, very clear. A note on the subject of these

improved forms will be found in our issue for June 16 last, p. 752.

A group of Pelargoniums (fancy, show and spotted), was staged by Mr. C. Turner, Slough, and were very fine when the time of year is considered, as it is now late for these plants. There were about fifty plants in all, chiefly of the show type. Ambassadors (fancy) is delicate rose, with a white eye, and is borne in large trusses. Spotted Beauty (spotted) is very pale carmine, each petal bearing a spot of intense carmine. Madame Marie Knecht, pure white, with a trace of a red spot on two of the petals. Vivid (show) is a bright-coloured variety, scarlet, with almost black spots. Buffalo Bill (spotted) is lilac, with dark purplish spots.

Messrs. J. Laing & Son, Forest Hill, S.E., sent a very extensive group of tuberous Begonias, arranged with Palms and Aralias, for which a Silver Bank-silver Medal was given. The following were fine:—Guardman, single, bright scarlet; Mrs. Petch, single, with crimson margin; Duke of Edinburgh, single, dark red; Princess Sophie, single, rose-lake; Rose Celeste, single, pale rose; Lord Loughborough, double, scarlet, and much crimped.

Messrs. H. Cannell & Sons, Swanley, Kent, also showed a few Begonias. Dr. Lowe, double, rosy-flesh, good full flower, was a fine bloom. They also had several cut blooms.

FIRST-CLASS CERTIFICATES.

To *Daphniphyllum glaucescens*, from Messrs. James Veitch & Son.

To *Calochortas venustus* var. *citrinus*, from Mr. Ware.

To *Enlalia japonica gracillima*, from Messrs. J. Veitch & Sons.

To *Cass-alpina japonica*, from Messrs. J. Veitch & Sons.

To *Epidendrum atro-purpureum*, from Sir Trevor Lawrence, Bart., M.P.

To *Epidendrum atro-purpureum*, from F. G. Tautz, Esq.

To *Rhododendron Hippolyta*, from Messrs. Veitch & Sons.

To *Pelargonium* (fancy) *Ambassadors*, from Mr. C. Turner.

To *Pelargonium* (spotted) *Spotted Beauty*, from Mr. C. Turner.

To *Striped Brier* (flower of), from Rev. H. H. D'Ombain.

To *Delphinium Figaro*, from Messrs. Kelway & Sons.

To *Pæonies Cyclops*, Miss Salway, Miss Brice, Agnes Mary Kelway, Maria Kelway, Lady Carrington, from Messrs. Kelway & Sons.

To *Delphinium Bassanio*, from Messrs. Kelway & Sons.

Fruit Committee.

Present: Dr. R. Hogg, in the chair; and Messrs. J. Lee, P. Crowley, R. D. Blackmore, G. W. Cummins, S. Ford, J. F. Rivers, W. Warren, J. Marshall, W. Denning, C. Ross, H. J. Veitch, T. J. Saltmarsh, G. Norman, J. Wright, and J. Willard.

Three lots of Melons were submitted from Mr. A. James, Woolston Rectory, Cheltenham; an orange-fleshed sort was shown, which had a bitter flavour. Mr. Gleeson, Clumber Gardens, Worksop, showed a large white-fleshed variety, of fairly good quality and flavour; and Mr. Bennett, Cobham, sent a green-fleshed sort, small in size, and also of good quality. Mr. C. Ross, Welford Park Gardens, sent a white Grape, a seedling from Black Monukka; it is, we understand, on trial at Chiswick, and no opinion of its merits was expressed.

Strawberries were exhibited from the Society's Garden at Chiswick, where they are just now ripening well. The examples sent were all of Mr. Laxton's raising, and included Noble, a large fruit of good flavour; King of the Earlies, medium size, good colour; and Admiral and Lieutenant were also shown. The Noble was also sent by Messrs. Paul & Son, Cheshunt.

A wire frame for supporting Melon fruits came from Mr. W. Hussey, Hains Hill, Twyford; it consists of a series of wire hoops, supported on uprights, and with a base made by a plate of zinc.

LINNEAN.

JUNE 21.—Dr. Maxwell Masters, V.P., in the chair.

Mr. F. W. Oliver exhibited the aquatic and terrestrial forms of *Trapella sinensis*, of which he gave a detailed account, illustrated by diagrams.

Dr. R. C. A. Prior exhibited a branch of the so-called "Cornish Elm," and described its peculiar mode of growth, which suggested its recognition as a distinct species. In the opinion of the botanists present, however, it was regarded as merely a well marked variety of the common Elm.

On behalf of Mr. R. Newstead, of the Grosvenor Museum, Chester, photographs and drawings of the Little Grebe, *Podiceps minor*, were exhibited, to illustrate a peculiarity observed in the mechanism of the leg bones.

Mr. A. W. Bennett exhibited under the microscope, and made remarks upon, filaments of *Sphaeroplea annulina* (from Kew), containing fertilised oospores.

Mr. Thomas Christy exhibited specimens of different varieties of Kola-nuts.

The following papers were then read:—1. Dr. P. H. Carpenter, on the "Comatulæ of the Mergui Archipelago;" 2. Professor P. Martin Duncan and W. P. Sladen on the "Echinoidea of the Mergui Archipelago;" 3. Mr. W. P. Sladen on the "Asteroidea of the Mergui Archipelago;" 4. Mr. W. Bolas on "South African Orchideæ;" 5. Mr. R. A. Rolfe, "A Morphological and Systematic Revision of *Apostasia*."

This meeting terminated the session 1887-88—one specially memorable as the Centenary of the Society.

ROYAL OXFORDSHIRE HORTICULTURAL.

JUNE 19.—This exhibition, held annually in Commemoration week, took place in the delightful gardens of Worcester College, a charming show being provided, but the weather was so cold and dull as to be more like March than June.

Plants (open).—The chief interest centred on these. In the class for nine stove and greenhouse plants in flower Mr. J. Cypher, Cheltenham, was an excellent 1st, with fresh and bright specimens of *Ixora Williamsii*, *Dracophyllum gracile*, *Bougainvillea glabra*, *Phænocoma prolifera* Barnesii, *Anthurium Scherzerianum* Veitchii, *Aphelexis spectabilis*, *Erica depressa*, and two *Azaleas*. 2nd, Mr. J. F. Mould, nurseryman, Pewsey, Wilts, in our report of the Reading show stated, in error, to be of Devizes.

Mr. J. Cypher had the best six Cape Heaths, having good examples of *depressa*, *ventricosa grandiflora*, *v. hisuta*, *Kingstoniana*, *tricolor* Wilsoni, and *t. elegans*. 2nd, Mr. H. James, with good plants of *tricolor* Wilsoni, *t. ventricosa*, and *Candolleana*. Pelargoniums in collections of twelve were not up to their usual mark. Mr. C. Turner's plants being badly missed. Mr. J. Mattock, nurseryman, Headington, was awarded a 2nd prize.

Cut Flowers: Roses.—Prizes were offered for twenty-four trebles, dissimilar—a large quantity to get thus early in such a season. Mr. J. Mattock was the only exhibitor, and was placed 1st with good examples of the following:—Catherine Mermet, *Souvenir d'Elise*, *Rubens*, *Perle des Jardins*, *Niphotos*, *Maréchal Niel*, *Devoniensis*, *Souvenir d'un Ami*, *Marie van Houthe*, *Jean Ducher*, *Madame Lambert*, and *Grace Darling*. In that for twenty-four varieties, single blooms, Mr. Geo. Prince, nurseryman, Oxford, was 1st, with some very good blooms, the leading varieties being *Comtesse de Nadaillac*, *Maréchal Niel*, *Madame de Watteville*, *Princess of Wales*, *Souvenir d'Elise Vardon*, *Grace Darling*, *Adam*, *Alba rosea*, *Duke of Edinburgh*, *Lady Mary Fitzwilliam*, *Niphotos*, and *Madame Lambert*. 2nd, Miss Watson Taylor, Headington.

Table Decorations.—The best three pieces, nicely arranged, came from Mr. J. Mattock; J. S. Parker, Esq., Ilfley, near Oxford, being 2nd. Then followed a number of classes for plants, the competition confined to members only.

Stove and Greenhouse.—G. H. Morrell, Esq., Headington, had the best collection of eight varieties, his best specimens being *Justicia carnea*, well bloomed; *Bougainvillea glabra*, *Tabernaemontana coronaria flore-pleno*, *Impatiens Sultani*, *Yuccas alba* and *rosea*. Mr. George Jacob, Mill Lane Nursery, Witney, had the best six plants—*Cattleya Mendelii*, *Oncidium sphaerulatum*, *Cypripedium barbatum*, and *Anthurium Scherzerianum* being his best specimens. The best specimen, variegated or ornamental plants were *Chamærops excelsa* and *Encephalartos villosus*. The best stove plant was a good piece of *Cattleya Gaskelliana* from Mr. G. Jacob (gr., H. Morrell) being 2nd, with *Ixora coccinea*. The best specimen hardy plant was a very fine piece of *Cypripedium spectabile* from Mr. R. Price, Headington; R. N. Byass, Esq., Rousham Park, being 2nd, with *Deutzia crenata* fl.-pl.

Orchids.—The plants of these were small but good. Mr. George Jacob had the best four, staging *Cattleya Mendelii* and *C. Mossiae*, *Odontoglossum vexillarium*, and *Cypripedium barbatum*; 2nd, C. A. Bevers, Esq., Oxford, with *Odontoglossum citrosomum*, *Dendrobium thyrsiflorum*, and *Cattleyas Meadellii* and *Mossiae*.

Miscellaneous Flowering Plants included *Gloxinias*, *Achimenes*, *Calceolarias*, very well shown by Messrs. J. Walker of Thame, and R. J. Johnson of Oxford. Of *Fuchsias*, a capital half-dozen came from Mr. J. Walker, Lye's *Charming* being specially attractive. In tuberous *Begonias* some very fair plants were staged; and there were also several classes for show, zonal and Ivy-leaved *Pelargoniums*. The variegated varieties, and especially those known as *tricolor*, are well done at Oxford, being nicely grown and finely coloured.

Ferns.—These were shown in sixes of exotic, and in two classes for nine and six plants. Some very good British *Ferns* were staged. The crowded tents prevented us from obtaining the successful exhibitors' names.

Cut Flowers.—There is one class for 24 bouquets that were made up small in order, it would seem, that they might be sold at the close of the show. It is a useless class in many respects, and it would be much better if it were changed for, say, a dozen bunches of stove and greenhouse cut flowers. There was also a class for nine bouquets. Single zonal *Pelargoniums*, one truss of each, were a good feature, Mr. J. Mattock being 1st, and Mr. John Walker 2nd. Mr. Geo. Prince had the best twenty-four cut *Roses*, showing some charming blooms; Dr. Bywater Ward, Warneford Asylum, being 2nd. Mr. J. Mattock had the best eighteen varieties, and Mr. A. Evans, Marston, the best twelve. There was also a class for nine varieties. It was pleasant to see some of the old-fashioned florists' *Ranunculus*—the best stand of eighteen blooms coming from Mr. P. Southby, Bampton. *Pinks* were shown, and also *Pansies*. Mr. Joseph Lakin had a fine lot of blooms of fancy varieties of the latter. Mr. J. Green, Oxford, had the best stand of nine bunches of double *Pyrethrums*. But the feature of the cut flower classes was the stands of twelve bunches of hardy perennials, for these were a very fine feature, Mr. Joseph Lakin, who, as an amateur, makes a great speciality of these plants, having very fine bunches indeed, chief among them being *Papaver orientale*, *Campanula glomerata* *Dahurica*, *Genm coccinium* fl.-pl., the double form of *Tradescantia virginica*, an orange *Erigeron*, fine double *Pyrethrums*, &c. Mr. R. Price, Headington, was a good 2nd, with *Hemerocallis flava*, *Heuchera sanguinea*, very bright; *Onosma taurica*, *Dictamnus fraxinella*, &c. These collections were deserving of much higher prizes than those awarded, and it is a feature that should be extended.

Fruit.—Of this there was a limited quantity. The best three bunches of white Grapes were Foster's *Seedling*, from Colonel Miller, Shotover House, Wheatley; Mr. Robins, The Gardens, Hartwell House, Aylesbury, being 2nd with the same variety; Mr. Geo. Parker, Great Tew Park, came 3rd, with Duke of Buccleuch. Mr. Parker had the best three bunches of black Grapes, showing good *Black Hamburgh*; R. N. Byass, Esq., Rousham Park, being 2nd.

The best dish of Peaches was Alexander, from Mr. Robins; Mr. P. Southby coming next, with *Stirling Castle*. The best dish of Nectarines, Lord Napier, was from Mr. Robins; *Pitaston Orange*, from G. H. Morrell, Esq., Headington, being placed 2nd. *Hero of Lockinge* was decidedly the best Melon. *Cherries* and *Strawberries* were also shown.

Vegetables.—A large number of classes were devoted to these; but the chief interest centered in the special prizes offered by Messrs. Sutton & Sons, Reading, and Messrs. E. Webb & Sons, Wordsley, Stourbridge. There was a good competition for these, but time did not admit of going into particulars.

Collections of wild flowers, shown by cottagers, were a very interesting feature indeed.

A ROSE SHOW AT THE ALEXANDRA PALACE.

JUNE 27 AND 28.—The managers of this undertaking, amongst the attractions of their programme for this season, have included horticultural exhibitions, and the first of these—a Rose show—took place on the above dates. It may be said to have been a modest revival of the more famous exhibitions which were held there from time to time in former years.

Besides the Rose show proper of the miscellaneous exhibits from various nurserymen appeared on the tables, and those of horticultural builders and sundriesmen in other parts of the central hall.

Roses: Nurserymen.—In the forty-eight single blooms, distinct, the 1st place was taken by Messrs. Paul & Son, Old Nurseries, Cheshunt, and whose best blooms, which—taken as a whole, were good for this unfavourable season—were Lady M. Fitzwilliam, François Levet, Countess of Rosebery, Rubens, Mrs. C. Wood, Violette Bowyer, Duke of Edinburgh, Maurice Bernardin, Souvenir d'Elise Vardon, M. Niel, Alba rosea, and Devonienses. Mr. C. Turner, Slough, was 2nd, with a lot of blooms, which ran Messrs. Paul & Son rather closely. Good blooms were observed in Madame Verdier, Annie Laxton, H. Schultheiss, Lady Mary Fitzwilliam, Perle des Jardins, Catherine Baumann, Elie Morel, and Madame de St. Jamain. Mr. W. Rumsey, Waltham Cross, was 3rd, with flowers much under his usual mark, but yet regular in form and even in size.

For twenty-four trebles of H.P.'s, the winners were the same as in the previous competition and in the same order; the Roses also were nearly identical as to variety. Lady Alice, Lady Mary Fitzwilliam, were nice flowers, as was American Beauty, a flattish formed Rose of purplish-crimson colour, in Messrs. Paul's stand. Mr. Turner had Baroness Rothschild, Dr. Sewell, and Ulrich Brunner, in good form. It was remarked that wherever Ulrich Brunner appeared it was always in good condition and of large size. Four competitors.

For twenty-four single blooms, distinct, Mr. G. Prince, Market Street, Oxford, took 1st honours; the Teas in his stand were marked by their usual excellence—Madame Cusin, Souvenir d'Elise Vardon, Amazon, bright yellow, fine, when half-opened; Souvenir d'un Ami, Devoniensis, Catherine Mermet. The 2nd prize fell to Messrs. G. & W. Burch, Peterborough; the best were—Camille Bernardin, E. Y. Teas, Ulrich Brunner, Alphonse Soupert, Dr. Andry, &c.—an even stand of fresh vigorous bloom.

For twelve Tea and Noisette, single blooms, Mr. Prince was not to be denied the 1st place; Messrs. Harkness Brothers, of Bedale, took 2nd place. Fine blooms noted in these stands were Perle des Jardins, Princess Alice, Souvenir d'un Ami, Catherine Mermet, Maréchal Niel, Jean Ducher. There were seven competitors.

Amateurs' and Gentlemen's Gardeners' Classes.—For the best thirty-six blooms, distinct, S. P. Budd, Esq., Bath, took 1st place, with flowers fairly good; the best of them, and those not observed in other stands, were La Havre, Queen of Queens, Pierre Carot, Dupuy Jamain, and Marie Van Houtte. The 2nd prize fell to Mr. J. Brown, Reigate, who had nice examples of Pride of Waltham, Mrs. Baker, Grace Darling, Comtesse Nadailac, Marie Cointet, and Star of Waltham.

For twenty-four single blooms, H.P.'s only, Mr. Budd was again 1st with nice bloom, of which mention may be made of A. K. Williams, Dupuy Jamain, Etienne Levet, Magna Charta, and Captain Christy. R. E. West, Esq., Firth Dean, Reigate, showed a small flowered, even lot of blooms.

For the best twelve blooms, distinct, there was much competition, the 1st prize falling to the Rev. E. G. King, Madingley Rectory, Cambridgeshire. Nice examples were Anna Olivier, Catherine Mermet, Maréchal Niel, Louis Van Houtte, and a bloom of La France, which was adjudged the best bloom in the exhibition, and took therefore the Silver Medal, value £2, offered by Messrs. W. Wood & Sons, Wood Green, N. The 2nd prize fell to Mr. Perry, gr. to Mrs. Rowlett, Cheshunt, Marie Baumann, Ulrich Brunner, C. Lefebvre, Comte Raimbald, and François Levet being the best of a rather small but nicely-finished lot of blooms. The Rev. Page Roberts took 1st prize for six Teas or Noisettes, and the Rev. F. R. Burnside, of Chipping Campden, the 2nd. As nice flowers in these stands we name La Boule d'Or, Caroline Kuster, Catherine Mermet, Souvenir d'Elise, Niphotos, and Maréchal Niel.

Open Classes.—In these classes of the competition the number of blooms required was small, to allow growers of moderate means to compete. Messrs. Paul & Son, Old Nurseries, Cheshunt, took the 1st prize with Mrs. John Laing in the class for any Rose.

In the class for new Roses, not in commerce, a new white Tea was shown by Mr. G. Prince, Oxford, named S. A. Prince. It is a dead white, very full, and likely to prove a valuable Rose of its colour, but more must be seen of it in a variety of soils and situations before deciding on its merits. Details of its parentage were not afforded.

The Rev. T. R. Burnside won the 1st prize for a

dozen of any yellow variety with Maréchal Niel—very superior examples; Messrs. Paul & Son were 1st for white Roses, showing Lady Alice, well done. Mr. C. Turner was 1st in the class for crimson with Marie Baumann; and the 1st prize for a dozen of any Rose not included in the above competitions with Lady Mary Fitzwilliam, a pale flesh-coloured variety.

In baskets of Roses Messrs. Perkins & Sons, Coventry, showed the trained hand and eye combine with good taste, taking the 1st prize; the 2nd falling to Anne M. Williams, Highgate Hill. Messrs. Perkins & Sons carried off the best prize for a hand bouquet, Miss Williams coming 2nd; and the 3rd in this and the previous class fell to Mr. W. A. Holmes, who spoilt his device by employing too much bloom and foreign foliage.

Messrs. Paul & Son led with twenty pot Roses, stocky floriferous plants, rather too abundantly staked; Mr. C. Turner taking 2nd place.

Miscellaneous exhibits came from Mr. B. S. Williams, consisting of Orchids, stove and greenhouse plants; Mr. H. B. May, Dyson's Lane, Upper Edmonton, sent a fine imposing group of choice varieties of Ferns, Dieffenbachias, Dracenas, &c.; Messrs. Hooper & Co., Maida Vale and Covent Garden, showed Lilies, Ornithogalum arabicum, Blandfordia flammaea, Campanula calycanthea, Adiantum Veitchii, Caladiums, &c.; Messrs. W. Cutbush & Sons had hard-wooded plants, Ferns, &c.; Messrs. Cooling, Bath; Turner, Slough; Prince, Oxford; W. Taylor, Hampton, showed Roses of various classes, not for competition.

Mr. T. Ware showed an excellent group of hardy flowers, such as he showed at the Drill Hall, Westminster, on the previous day, and took the Silver Cup, valued at £4, given by Mr. W. Colchester, of Colchester, the proprietor of Icthemie manure.

Mr. Newton, of Hitchin, whose ingenious and durable glasshouses were mentioned, and the method of glazing illustrated in our pages, showed a section of one of his houses, fitted with a very ingenious yet simple raising gear for ventilators, worked either in or outside a house.

Mr. Peel, High Street, Wood Green, likewise showed wooden greenhouses for amateurs, portable, and very cheap.

LAW NOTES.

THE NON-GUARANTEE CLAUSE.

REYNOLDS v. WRENCH & SONS.—This case, which involved the question of the validity of the non-guarantee clause used by wholesale seedsmen, came on in the Court of Appeal, before Lord Esher and Lords Justices Lindley and Lopes, on the 21st inst. It was an appeal by the defendants from the refusal of the Divisional Court (confirming the judgment of Mr. Justice Denman) to allow their counter-claim against Mrs. Reynolds for damages claimed under the circumstances reported in a previous number, pp. 115 and 590. The Court dismissed the appeal, and the question is now therefore finally decided unless the defendants take the case to the House of Lords, which it is understood it is not their intention of doing. The clause has now been upheld by every Court before which it has been argued.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending June 25, is furnished from the Meteorological Office:—

"The weather has varied greatly in different parts of the kingdom. Over Ireland and Scotland it was generally fine, but in most parts of England the conditions were dull and unsettled, with severe thunderstorms in many places. Towards the end of the period thunderstorms were experienced in some parts of Ireland also. On our S. and S.W. coasts much fog or mist prevailed at times.

"The temperature has differed considerably in the various districts. It has been on the whole rather above the mean in Ireland and the west of Scotland, slightly below over the west and south of England, and from 3° to 6° below over the east and north-east parts of the kingdom. At the commencement of the period the thermometer was extremely low for

time of year over our more southern counties. In London and at Cambridge the maximum was only 53°, at Rothamstead 52°, and at Hillington 51°. As the week advanced, however, temperature increased very generally, and on the 25th maxima between 80° and 85° were recorded in most parts of Great Britain. The lowest of the minima were registered in most places either on the 19th or 20th, when the sheltered thermometer fell to between 34° and 37° over the inland parts of Scotland, to 35° over the 'Midland Counties' and 'England N.W.', and to between 40° and 45° elsewhere.

"The rainfall has been almost entirely absent from Scotland, and considerably less than the mean over Ireland and the west and north-east parts of England, but in the 'Midland Counties' and 'England S.' an excess is shown.

"Bright Sunshine has been very deficient over southern, central, and south-west England, but over Ireland, Scotland, and the north of England the percentage of the possible amounts of duration ranged from 42 to 66.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING JULY 1. (AVERAGE OF FORTY-FOUR YEARS.)

July 1	62°7	July 5	63°1
" 2	62°8	" 6	63°1

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

COAL SMOKE AND FLUES: *J. B.* Fill up all joints with fire-clay, or good brick-making clay failing that, and mix with horse-droppings or chaff. Near the furnace the clay must be put on liberally; or some cement may be used there for covering and filling the joints. It will require frequent examination, or injury to the plants will ensue.

CORRECTION.—We regret that inadvertently our remarks on the show of Rhododendrons in the Row, Hyde Park (see p. 778, in our last issue), made by Mr. Antony Waterer, got attached to one dealing with Mr. J. Waterer's exhibition of these plants in Cadogan Place.

FUNGUS ON GRASS: *Mrs. A. Dixon.* The white fungus growing on the grass is the immature state of *Epiclône typhina*, Ful. Very common on all species. It is one of the Ascomycetes figured in *Greville's Scot. Crypt. Flora. M. C. C.*

HOLLY HEDGE: *E. C. L.* In August early.

HYPERICUM, SUPPOSED HYBRID: *C. W. D. H. Bursari.*

JASMINUM SAMBAC: *A. N. J.* Fusion of two or more flowers is not unusual in this plant. No doubt it arises from over-luxuriance.

MILDEW ON GRAPE VINES: *J. E. & S.* Apply sulphate of potassium at the rate of $\frac{1}{2}$ oz. to 1 gallon of rain-water, with the syringe. Allow it to remain ten minutes, then syringe off with clean water. Keep the house rather warmer, and be careful about the ventilation. See our issue for June 2, p. 697.

NAMES OF PLANTS: *S. M.* 1, *Thymus serpyllum* var. *pubescens*; 2, *Valeriana officinale*; 3, *Syringa Josikea*; 4, *Lathyrus latifolius*; 5, *Dianthus plumarius*.—*A. B.* 1, *Calycanthus floridus*; 2, *Platneria Richardi*.—*J. W.* *Podophyllum peltatum*.—*M. A. H.* *Abies orientalis*; *Cratægus coccinea*.—*F. N. B.* 1, *Hedera Regnieriana*; 2, consult some grower of Ivies.—*D. T.* 1, *Ulmus*; 2, *Pyrus salicifolia*; 3, *Cratægus coccinea*.—*W. C.* The white variety of the common Foxglove (*Digitalis purpurea*).—*Atticus.* 1, *Campanula glomerata*; 2, *Stenactis*; 3, *Aster*, not recognised; 4, *Tanacetum Balsamita* (the Costmary); 5, *Lilium Martago*; 6, *Barbarea vulgaris* double flower.—*E. Scaplehorn.* *Lonicera tomentella*.—*W. & S.* *Arthropodium cirrhatum*.—*W. S.* 1, *Geranium pratense*; 2, *Astrantia major*; 3, *Trollius europæus*—Globe flower; 4, *Polemonium œreum*; 5, *Tiarella cordifolia*; 6, *Grevillea rosmarinifolia*; 7, *Centaurea montana*.—*C. W.* *Oncidium pulvinatum*; *Cattleya Forbesii*.—*W. T. O.* *Epidendrum aromaticum*; *E. cochleatum* (the larger flower).—*J. C.* 1 and 2, *Epidendrum fragrans* vars.—*W. P. S.* *Schomburgkia tibicinis*.—*Constant Reader.* 1, *Dendrobium chrysotoxum*; 2, *Oncidium flexuosum*; 3, *Dendrobium suavisimum*; 4, *Clerodendron Thomsonianum*.—*E. Cooper.* *Læloopsis domingensis*.—*C. E. B. I.* 1, *Sedum sarmetosum*; 2, next week; 3, *Centaurea cyanus*; 4, *Phlebotium aureum*; 5, *Pteris arg.*—*Subscriber.* *Catalpa bignonoides*.—*C. W. D.* *Hypericum*, supposed hybrid, *H. Bursari*.

ORANGE RUST ON ROSES: *J. M.* You are lucky to have been a Rose grower so long and not seen it. A full description and figure is given in our Rose Supplement, July 7, 1877. Cut off the affected branches and burn them.

PANSIES: *W. Caudwell.* Some good flowers amongst those sent, but the bulk of them were deficient in substance, regularity, and finish. Further selection and care in hybridising are required to produce first-class flowers.

PARIS MARKET GARDENING: *J. A. S. Gleanings from Paris Gardens, W. Robinson, F.L.S. (F. Warne & Co., London).*

QUASSIA CHIPS: *J. E.* For black-fly, 4 oz. to be boiled for 10 minutes in 1 gallon of rain-water. Greenfly may be killed with rather less Quassia chips per gallon. It may also be made much stronger, and the decoction added in any desired proportion to clear water. Soft-soap, at the rate of 3—4 oz. to the gallon, increases the destroying and defensive properties of Quassia-water.

STRAWBERRY CAPTAIN: *A. B.* A nice-flavoured, useful, early variety.

TOMATO DISEASE: *R. S.* See our number for Nov. 12, 1881, p. 621. Burn the plant.

CATERPILLARS: *Many Correspondents.* The destruction is caused by the caterpillars or grubs of various insects. The Ermine moth (*Hyponomella padella*), which strips Thorn, Apple, and other trees, fastening their shoots together by fine webs. Our illustration (fig. 114) shows a species which attacks the Apple, *H. malivorella*. Hand-picking is the only remedy

FIG. 114.—THE ERMINE MOTH.

at present available. When the perfect insect appears, lay a sheet beneath the branches, and shake the branches vigorously so that the insects fall into the sheet, when they may be easily destroyed. The grub of the pretty little winter moth is also very destructive. It is a "looper," as shown in our illustration (fig. 115). At first they are grey, but are afterwards shining-green, with a blue line down the back, and two yellowish-white lines on either side, and a few scattered hairs. These creatures also tie the leaves together with their webs, and are extremely destructive to fruit trees. On the first appearance of the moth, in October or November, fasten a strip of brown paper round the trunk of

FIG. 115.—THE WINTER MOTH.

the tree and paint it over with oil or tar, when large numbers of the wingless egg-laying female moths may be caught. Lastly, encourage birds, such as tom-tits and starlings. The moths, if not checked in this way, will deposit their eggs on the branches of the trees, or on the buds, where they remain all the winter uninjured by the cold and wet, and are hatched in spring and early summer.

TEA ROSES. GARAWAY CO. offer 12 of the above, best named sorts, including MARECHAL NIEL and NIPHETOS, in 5-inch pots, for 10s. cash. GARAWAY CO., Durdham Down, Clifton, Bristol.

SPECIAL CHEAP OFFER. Package and Carriage Free. IMPATIENS HAWKERII, a lovely new winter-flowering greenhouse plant, three for 2s. 6d. Twelve DAHLIAS, choice exhibition var., 3s.; Mrs. Sinkin, pink, 2s. 6d. per dozen. MARGUERITE Madame Chambour, best yellow, 2s. 6d. per dozen. IRESINE Lindeni and Brilliantissima, 4s. per 100. LOBELIA Emperor William, Crystal Palace Gem, compacta, Prince of Wales, white, strong plants from cuttings, 2s. 6d. per 100. CHRYSANTHEMUMS, Japanese, Incurred, and Pompon, true to name, in single pots, 10s. per 100; from store pots, 5s. per 100. C. CUNDY, F.R.H.S., The Nurseries, Sudbury, Suffolk.

BEDDING PLANTS.—Vesuvius, H. Jacoby, M. Christine, Niphetos, West Brighton Gem, &c., 1s. 9d. per dozen; Calceolarias, 1s. 3d. per dozen; 10,000 Lobelias, from cuttings, large plants, 7s. 6d. per 100, all out of pots; 7000 scarlet Geraniums, out of boxes, strong plants, 7s. 6d. per 100, large reductions by the 1000; Mesembryanthemum, 6s. per 100, 50s. per 1000; Pyrethrums, Stocks, Asters, Zinnias, Sunflowers (tall and dwarf), Wallflowers, Tropæolums, &c. AUGUSTUS MOORE, St. John's, Spalding.

Carnations, Pinks, and Picotees, from Seeds. The Flower of the Gods! (Dianthus: dios, divine, and anthos, flower).

WILLIAM BAYLOR HARTLAND is offering for Summer Sowings his celebrated strain of the above. His "White Rosette" Clove-scented Carnation is richly perfumed, and snow-white in colour, resembling a "Rosette," and possessing the valuable property of not splitting in the calyx even in the hottest weather, and for buttonhole work and general cutting purposes is unequalled. CARNATION, Yellow, Bizarre, and Self, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d. Yellow, Flake, 12 varieties, separate, per collection, 4s.; mixed packets, 1s. and 2s. 6d. Hartland's White Rosette, Clove-scented, own savings, per packet, 1s. Scarlet Grenadin, or floribunda coccinea, large packet, 2s. 6d.; per packet, 6d.; beautiful. Perpetual, or Tree, for pots, superb, per packet, 1s. PICOTEE, Yellow and White Grounds, 12 superb varieties, 4s. 6d.; mixed, packet, 1s. PINK, very choicest, mixed. Some single forms will be found included in this choice strain, and they are very beautiful. Per packet, 1s. Mrs. SINKINS, selected from a lovely non-splitting form of this well-known plant, and own saving, 1s. and 2s. 6d. *W. BAYLOR HARTLAND, F.R.H.S., Seedsman, 24, Patrick Street, Cork.

CLEARANCE SALE OF STRONG HEALTHY PALMS. *Lantana borbonica*, *Scaevola elegans*, *Phoenix reclinata*, &c., 20 to 24 inches high, 16s. per dozen. Same kinds, 2 ft. 6 in. to 3 ft. high, 3s. to 5s. each. Handsome Palms for decoration, 5 ft. 6 in. to 6 ft. high, 70s. per pair. Small Palms, 10 to 12 in. high, 4s. per dozen. Kentias, from 3s. to 21s. each. Fine Dracænas, from 2s. to 30s. each. Over 50,000 Palms to select from. B. OWEN, The Palm Gardens, Stamford Hill, N. A Visit solicited.

Hooper's The Covent Garden Seed Warehouse. Excellent seeds and bulbs at low prices. Catalogues free to all who apply.

CARSON'S PAINT Patronised by 16,000 of the Nobility, Gentry, and Clergy, for all kinds of OUTDOOR WORK, CONSERVATORIES, Greenhouses, Frames, &c. 1 Cwt., and Oil Mixture, Free to all Stations. Liquid Non-Poisonous Paints for Inside of Conservatories, &c. Prices, Patterns, and Testimonials, Post-free. LA BELLE SAUVAGE YARD, LUDGATE HILL, E.C. BACHELOR'S WALK, DUBLIN.—Discount for Cash.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. Hovey, Boston, U.S.A., May 27, 1887."

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 55 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

HOLLOWAY'S OINTMENT and PILLS are the best, the cheapest, and the most popular remedies. At all seasons and under all circumstances they may be used with safety and with the certainty of doing good. Eruptions, Rash, and all descriptions of Skin Diseases, Sores, Ulcerations, and Burns are presently benefited and ultimately cured by these healing, soothing, and purifying medicaments. The Ointment rubbed upon the abdomen, checks all tendency to Irritation of the Bowels, and averts Dysentery and other Disorders of the Intestines. Pimples, Blotches, Inflammations of the Skin, Muscular Pains, Neuralgic Affections, and Enlarged Glands can be effectively overcome by using Holloway's remedies according to the "instructions" accompanying each packet.

CADBURY BROS. caution the Public against those Dutch Cocoas and their English imitations sold as pure Cocoa, to which about 4 per cent. of Alkali and other agents are added, to give apparent strength to the liquor, by making it a dark colour. This addition may be detected by the scent when a tin is freshly opened. No Cocoa can be stronger than Cadbury's, which is guaranteed **ABSOLUTELY PURE.**

"A Refresher"

A Few of the many Good Reasons why Cadbury's Cocoa enjoys such World-wide Popularity.

It is guaranteed to be Pure Cocoa.
 It is Soluble in Boiling Milk or Water.
 It is not reduced in value by the addition of Starch, Sugar, &c.
 It is specially rich in flesh-forming and strength-sustaining principles.

It contains all the delicious aroma of the natural article, without the excessive proportions of fat.
 It is delicious, nutritious, digestible, comforting, and a refined beverage, suitable for all seasons of the year.

It is a gentle stimulant, and sustains against hunger and bodily fatigue.
 In the whole process of manufacturing Cadbury's Pure Cocoa, the automatic machinery employed obviates the necessity for its being once touched by the human hand.
